From: Russ Abbey
Topic: 6424 Message: 6860

Hi All,
Hope everyone had a good Thanksgiving. First: Undertow does not support the PmapServ7 at all! While at one point they did, they disavow any knowledge at this time, they only supply the mapping software. PmapServ7 (I think) and UIView32 was written by Roger Barker G4IDE (SK) who died in 2004, and had the source code destroyed to UIView32 and 16. There for there will be no updates to UIView or PmapServ7 unless someone cracks the code and updates it. So this thing about "why doesn't someone update the programs" now has an answer and has had an answer for at least the last 5 years if anyone bothered to read anything at the uiview.org web site.

So it would seem that the solution is for someone that has the time and the Know how to write another program to do what UI-View does. or find another app. Not much use trying to ride a dead horse, this problem isn't going to go away.

It's possible to keep UI-View and the computer it's running on without
any OS upgrade.

6865. Re: [APRS] KPC 3+ issue

Yahoo group: APRS (2007 — 2010)
Date: 2009-11-30 20:02:44 UTC
From: Mark Garrett
Topic: 6819 Message: 6865

Hi All:

An update in that I was able to change the beacon time from 12:00:00 to something a lot more often. BLT 1 down to 10 minutes, BLT2 now at 25 minutes and BLT3 and 4 around 45 minutes although I am mostly using 1 and 2. Beacon messages are now correct so it is operating more correct. Locals are impressed with the coverage so far and it fills a lot of coverage holes. A big thanks to all of you for offering help and guidance in getting me past some of these hurdles.

Now on to the next issue is the truncated messages that I currently have. What I see when I boot up and most commands is that I am missing the first half of the message or response I get from the KPC 3+. I want to try and lower the speed of the com port down from 9600 to 2400 to see if this possibly resolves the issue. I would go lower but the manual states the lowest setting is 2400 baud. I have used Hyper term on several different computers with no difference using the settings described in the manual. How do I go about to lower the baud rate on the KPC3+? I though Autobaud would address it but it appears not to be set correctly and the instructions are vague in manually setting the rate.

Mark, KA9SZX

Yes, I kept looking for it. I had just re-established access to this
group, so maybe it is a new user-moderated or something procedure...

Let us know if you successful in updating your KPC-3+.

I use a non-plus KPC-3 for APRS I-Gate, but it has never been operated
any way other than in KISS mode with UI-View.

Cheers and 73,
Stan/KC7EHJ

the nuvi 350 is a little better because its know for not duplicates waypoints as you can see from the information on this site http://wiki.argentdata.com/index.php/Garmin_FMI also don't forget the nuvi gps doesn't do NMEA you would have to have the GTRANS Garmin to NMEA Translator Cable.

Subject: [APRS] New group member query

I'm interested in getting my feet wet in APRS. Use would be primarily location tracking in the mobile, traveling frequently between North Carolina and New Jersey to visit grandchildren. I'd like to be able to integrate my Dell Inspiron Laptop with either my Garmin E-Trex Legend C or Nuvi 255W. Santa will be supplying a new Kantronics KPC-3+. I'd like to be able to use my Yaesu FT-60R handheld as the transceiver. Can anyone provide recommendations re software, equipment integration, etc., or share their experiences with similar setups? Many thanks.

Believe your looking for the command 'abaud'. If you type it by itself
you should see the current baud. If you type numbers after it you'll get
the change you type. To make sure it's changed always type 'abaud' after
your finished to make sure it took.

I want to try and lower the speed of the com port down from 9600 to 2400 to see if this possibly resolves the issue. I would go lower but the manual states the lowest setting is 2400 baud. I have used Hyper term on several different computers with no difference using the settings described in the manual. How do I go about to lower the baud rate on the KPC3+? I though Autobaud would address it but it appears not to be set correctly and the instructions are vague in manually setting the rate.

6874. Re: [APRS] KPC 3+ issue

Yahoo group: APRS (2007 — 2010)
Date: 2009-12-01 15:57:16 UTC
From: Mark Garrett
Topic: 6819 Message: 6874

Hi Stan:

I want to say I have tried this but will try it again and see if it solves my problem. I am due to head out there in a day or so to work on other items and will see if this works. BTW: several hams have commented very positively about it already as it fills a large hole of what was zero coverage areas.

Mark,

Subject: Re: [APRS] KPC 3+ issue

Believe your looking for the command 'abaud'. If you type it by itself
you should see the current baud. If you type numbers after it you'll get
the change you type. To make sure it's changed always type 'abaud' after
your finished to make sure it took.

Mark Garrett wrote:
> Hi All:
>
> An update in that I was able to change the beacon time from 12:00:00 to something a lot more often. BLT 1 down to 10 minutes, BLT2 now at 25 minutes and BLT3 and 4 around 45 minutes although I am mostly using 1 and 2. Beacon messages are now correct so it is operating more correct. Locals are impressed with the coverage so far and it fills a lot of coverage holes. A big thanks to all of you for offering help and guidance in getting me past some of these hurdles.
>
> Now on to the next issue is the truncated messages that I currently have. What I see when I boot up and most commands is that I am missing the first half of the message or response I get from the KPC 3+. I want to try and lower the speed of the com port down from 9600 to 2400 to see if this possibly resolves the issue. I would go lower but the manual states the lowest setting is 2400 baud. 6875. Re: [APRS] KPC 3+ issue

Yahoo group: APRS (2007 — 2010)
Date: 2009-12-01 22:45:54 UTC
From: Stan Coleman - N0YXV
Topic: 6819 Message: 6875

Side Note On your BLT settings:
Somebody correct me if I'm wrong here but I think your Beacons would
go like this:

Settings:
BLT1 10
BLT2 25
BLT3 45
BLT4 45

Results:
10:10AM BLT1
10:20AM BLT1
10:25AM BLT2
10:30AM BLT1
10:40AM BLT1
10:45AM BLT3
10:45AM BLT4
10:50AM BLT1
10:50AM BLT2
11:00AM BLT1

11:10AM BLT1
11:20AM BLT1
11:25AM BLT2
11:30AM BLT1
11:30AM BLT3
11:30AM BLT4
11:40AM BLT1
11:50AM BLT1
11:50AM BLT2
12:00PM BLT1

If I'm not mistaken the way you have it BLT1 goes EVERY 10 minutes not
at 10 after the hour. BLT2-4 respond in the same fashion beaconing
every 25 and 45 minutes respectively. Did you really mean to have 10
beacons an hour?

I know of at least one such program in development. Watch this space
for details as soon as they are available...

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile (and soon Win32)

PS. http://groups.yahoo.com/group/APRSISCE/

Nice guide, but I would make two changes...
1) The "7" is for ANY HT or man-portable system, not just
kenwood
2) We originally proposed -11 for APRS touchtone users, but then
quickly changed that more than a year ago to -12.

This is because Balloons which have always been exclusively -11,
are so exciting, that we do not want to dilute their impact by
using -11 for anything else.

Please get this to the author of that web page for updating .

are you running them both at the same time? I always wondered about the rules about running aprs in a vechial that your not in? anyone have any idea? like if I run aprs in my semi truck I share with and I have one other person that runs the truck, what if I forget to take it out of the truck and it runs, can I get in trouble if I'm not around the system?

Morning all,

What if your running more than one mobile unit? I have two vehicles that I will have with my call sign for tracking.

Suggestions?

Thanks

This will be run in my wife's car and it will be wired to the ignition so it controls the power for the unit. And yes you can according some rather lengthy discussions on the aprs sig. As long as the only setting that can be controlled by the operator is the power you can.

Might just have to see what I can come up with as it will be my tracker in the truck as well as the wife's car.

Course you add in the fact that there will be a home station as well.

Thanks

Peter

So, where would ""Portable Units such as Laptops, Camp Sites etc"" be supposed to go? They are listed as -12 on many many lists such as the one at:

http://info.aprs.net/index.php?title=SymbolsAndSSIDs

Just google that quoted phrase and I suspect you'll find as many listing that as -12 as list the APRStt.

Lynn (D) - KJ4ERJ - Just wondering where the displaced portables should land...

As owner of the zlhams wiki, I am inclined to replace "my" wiki's page with a link to the "main" http://info.aprs.net/index.php?title=SymbolsAndSSIDs page, as the subject is not specific to New Zealand but is a worldwide 'standard'. This means everybody is on the same page (sorry...) and newbies don't get confused with obsolete reccomendations from a variety of websites that should all be saying the same correct thing.

73, David ZL3AI.

6890. Tier 2 Server Stats

Yahoo group: APRS (2007 — 2010)
Date: 2009-12-05 15:42:32 UTC
From: Mike Besemer (WM4B)
Topic: 6890 Message: 6890

I was just reading through some old emails and came across some references to checking my connection statistics via the ARPS Server Status page. I'd forgotten which server I was connected to so I had to go check, and as it turns out I'm connected to one of the Tier 2 servers (noam.aprs2.net).

So, the question is... how do I check my status? As I understand it, the Tier 2 servers rotate addresses, so I really don't know which physical server I'm attached to.

I'm not having any issues or problems... just catching up on emails over a cup of coffee and curiosity got the best of me.

Great idea. Thanks.. But it has the same error for -11 and -12.
But it is good we are finding these and getting them fixed.

So as we're getting them fixed, we need to make sure to not remove the
current recommendation for -12, but ADD the APRStt to the same -SSID, right?

I have no idea, I'm still learning and unlike some hams I'm welling to say I'm still learning. that's why I posted what my plans are. I'm not like some hams that just throw a setup up and say my ways are better then anyone elses. I know of one station that always hit the system with a rate limit under 5 secs and has a red warning all the time and wont change (if you want to know the call sign send me a message off of group).

Sounds like the approach I'd use. I'm currently running:

-2 - Wide1 Digi / IGate w/javAPRSsrvr
-7 - TinyTrak4/Icom HT radio for -2
-8 - Loaner Kenwood D7 from AI4GK
-9 - T2-135 mobile (Snowmobile, a white car in Florida)
-12 - APRSISCE for Windows Mobile on my AT&T Tilt phone
-14 - former T2-135 mobile GMC Safari Van (now KJ4OVQ-9)
-15 - APRSISCE for Win32 APRS-IS client on my laptop
-xx - Various APRS-IS-only clients running APRSIS32 (APRSISCE for Win32)

One way would be to simply open a command prompt, and type 'netstat' (without the quotes) and track down ip's or domains you don't know. Could be easy, and the aprs server will pop up.

Hadn't thought of that, but it works. I can also check on ARPS.FI to see where I'm connected and go that route. I was just wondering if there was a more direct route. (Too much time on my hands today!)

From: Peter Dakota Summerhawk
Topic: 6877 Message: 6900

Morning,

I am still at a loss as to what numbers to use for both trackers in the cars for each. One is mine for my truck and one for the wife's car. Could you use the same call sign and SSID but have two different icons? Would that work or would it cause problems on the system?

Let me know as I don't want to cause problems in the system but still be able to track both vehicles.

Thanks

Great idea. Thanks.. But it has the same error for -11 and -12.
But it is good we are finding these and getting them fixed.

Mike,

Thanks for that I have both trackers but neither one are on right now until I can get the numbers figured out as to what they should be. Both are going to be automatic and unattended so I am at a loss as to what number should be used for SSID.

Thanks

Peter

Morning,

I am still at a loss as to what numbers to use for both trackers in the cars for each. One is mine for my truck and one for the wife's car. Could you use the same call sign and SSID but have two different icons? Would that work or would it cause problems on the system?

Let me know as I don't want to cause problems in the system but still be able to track both vehicles.

Thanks

That sounds like a good idea. The truck is an SUV but that would fit the profile wouldn't it? That way the car has one at -9 and the SUV has one at -14 Unless anyone has any objections I will do that and then follow the rest of the protocols for the list that was posted.

6905. Re: [APRS] APRS SSID

Yahoo group: APRS (2007 — 2010)
Date: 2009-12-06 00:51:32 UTC
From: Ron Tonneson
Topic: 6877 Message: 6905

Peter,

That has worked fine for me, I also use -4 on my bicycle and -13 on my motorhome. With modern APRS display software it actually does not mater which SSID you use as long as each different source has a unique SSID. Modern software uses the symbol field to determine the displayed icon.

6906. RE: [APRS] APRS SSID

Yahoo group: APRS (2007 — 2010)
Date: 2009-12-06 00:54:50 UTC
From: Christopher K. Greenhalgh
Topic: 6877 Message: 6906

-14 is designated for "truckers", which I interpret as "semi
tractor/trailers".

Semantics I suppose, but IMHO, a pick-up should be a -9.

Regards,

-Chris

6907. New Member - Old Questions??

Yahoo group: APRS (2007 — 2010)
Date: 2009-12-06 01:10:17 UTC
From: va3qf@rogers.com
Topic: 6907 Message: 6907

Hello all -
I am new to this group and new to APRS, so I hope you will forgive a few questions that may have blindingly obvious answers!!

My plan is to use the Alinco DR-135T with internal Argent Tracker 2 modem connected to my Nuvi 350 GPS.

1) When connecting the GPS to the modem, I understand that it invokes the "Fleet Management" capability of the 350 and lists APRS objects as "Favorites." Do these delete the existing "Favorites" that I may already have programmed into the Nuvi?
2) Depending upon the answer to 1) above, can I still select my existing "Favorites" and navigate to them while using APRS?
3) For what applications do people use the Short Message Service inherent within APRS?

Regards,
Keith VA3QF

Peter,

Have your wife get her license and you can use her callsign. That also gives you an excuse to buy more radios!

73,

Mike

That sounds like a good idea. The truck is an SUV but that would fit the profile wouldn't it? That way the car has one at -9 and the SUV has one at -14 Unless anyone has any objections I will do that and then follow the rest of the protocols for the list that was posted.

6910. OT: [APRS] Spammer making the rounds.

Yahoo group: APRS (2007 — 2010)
Date: 2009-12-06 04:28:40 UTC
From: N4AOF
Topic: 6910 Message: 6910

'Fraid not -- no spam has ever appeared in any of MY groups, and I don't expect any.

The key is to understand the tools that Yahoo makes available to group owners to configure and manage their groups.

If you understand those tools you will quickly see that requiring approval for new members is a total waste of time for 99% of groups. Requiring approval for new members is useful IF AND ONLY IF the owner is concerned about who gets to READ the material posted in the group. This can be appropriate for groups being used as a mail distribution list server by organizations that have specific real life members outside Yahoo. Then it can make sense to check new group members against the real life organization roster - assuming, of course, that there is some reason to care who gets to read the messages posted in the mail list.

For the vast majority of groups, there is no reason to bother trying to control who can READ the material posted to the group -- the real concern is to control who can POST messages to the group. This is an entirely different situation from controling who can read group messages, and requires using completely different tools.

To avoid having a group spammed, first of all, either turn off the calendar function entirely -- or, if you really need the calendar, limit posting calendar events so only moderators can post events to the calendar. Yahoo group calendars are a major entry point for smart spammers. Likewise, don't allow ordinary members to upload files to the group files area unless you are running a files sharing group (in which case, you should expect that most of the files uploaded will be spam uploaded as either html or text files (note also that Yahoo will let you post a text file using an mpg extension as the file type; which is a favorite trick of spammers in 'adult' groups on Yahoo).

So far as message posting is concerned, the simplest and most effective method is to configure the group for "open membership"; "all members may post messages"; and "moderate new members" -- the combination of these three specific settings will make any group very nearly spam-proof. The only spam you will ever see will be from the occasional total idiot who falls for a phishing scam like Grouply - a situation which is easily rectified by instantly banning anyone who is identified as having joined Grouply or any similar service. (I also recommend instantly banning any idiots who use a Challenge/Reply spam filter system and any idiots who turn on the Out Of Office Reply function in their mail software -- neither of these is actually spam but banning such idiots is a reasonable step to take simply because shooting them isn't legal).

6911. Re: NEED HELP ABOUT DX CLUSTER ON APRS

Yahoo group: APRS (2007 — 2010)
Date: 2009-12-06 03:20:46 UTC
From: k6jeb
Topic: 921 Message: 6911

This is exactly what I joined this group to find out. But it's not looking promising.

Here's what I want to do:

I camp in the summer in the surrounding hills and sometimes bring a QRP rig and even my APRS-enabled smart phone. Well, since there are so many APRS stations (and no longer any more DX Cluster *PACKET* stations) I thought it would be handy to have a DX Cluster on APRS.

A lot of times the hills I camp in have NO cell phone connection (which is why I go there in a way).

Basically, has anyone ported or made DX-CLuster-like information available over APRS? If so, can you point me in the right direction?

>Could you use
>the same call sign and SSID but have two different icons? Would that work or
>would it cause problems on the system?

No trouble to the system at all. It will work regardless of which
SSIDs you choose. When the one stations sends its beacon, it will
appear on the map at it's position and with the chosen symbol. When
the other stations sents it's beacon, the first one will disappear or
grey out, and the same SSID will appear on the other station's
position and with that particular symbol.
>
>Let me know as I don't want to cause problems in the system but still be
>able to track both vehicles.

But - if you use the same SSID for both vehicles (or for two stations
for that matter), and they are both driving around at the same time at
different places, it will appear on other users' displays as if the
one station is rapidly moving from one place to another, showing the
one radio station which sent it's beacon most recently. The track e.g.
at aprs.fi will show long jumps from one road to the other. You
wouldn't want that, i think. You might want to use -9 for one and e.g.
-8 for the other. The strict use of the original SSID list has ceased
as symbols became available.

6913. Re: NEED HELP ABOUT DX CLUSTER ON APRS

Yahoo group: APRS (2007 — 2010)
Date: 2009-12-06 07:49:47 UTC
From: Peter Schrader
Topic: 921 Message: 6913

It has been done, pretty much for exacly the same reasons.

A DX Cluster feed (one-way) is transmitted via APRS via VK4EA-2, and on UHF to avoid cluttering up the local VHF APRS allocation.

I use UIView32, SV2AGW Packet Engine Pro and M0YCP's UI-DX Bridge at the IGate end, in the field I use SV2AGW's AGWCluster software, or UIView is DXCluster Spy mode.

Being on the VK UHF APRS frequency means I am able to provide portable and home stations the full VK and ZL APRS feed as well as DXCLuster spots, without cluttering up 145.175 (our version on 144.300).

73,
Peter

From: Lynn W. Deffenbaugh (Mr)
Topic: 6890 Message: 6915

Interesting question that I hadn't thought about before. If you're on windows, you could check to see what active connections are using port 14580 (assuming you're using a filtered connection). Open a command prompt and enter:

netstat -an | find ":14580" (That's a vertical bar and the 14580 is inside double quotes)

The right hand column's IP address is the actual server you're currently connected to. Enter that IP in a browser and connect to port :14501 and search that status page for your callsign to see your status. The actual URL for the status page would look something like:

http://74.222.247.245:14501/

If you're on *nix, there are similar commands, but I don't know them off the top of my head.

I'm connected to firenet.us:2023 right now on Linux (w/Xastir):

> netstat -n | grep 2023
tcp 0 0 192.168.1.2:34846 165.91.140.47:2023 ESTABLISHED

The "-n" makes netstat write out numeric addresses and ports, else
the port name ends up with a wrong guess due to entries in the
/etc/services file which name each port. For instance:

> netstat | grep fire
tcp 0 0 wapiti:34846 firenet.:xinuexpansion3 ESTABLISHED

The best place to discuss the Tracker2 (in any form) is on the tracker2 mailing list. You'll find quite a few people on there that own the same equipment you're talking about, plus the developer of the Tracker2 hangs out there.

> 1) When connecting the GPS to the modem, I understand that it

> APRS objects as "Favorites." Do these delete the existing
> "Favorites" that I may already have programmed into the Nuvi?
> 2) Depending upon the answer to 1) above, can I still select my
> existing "Favorites" and navigate to them while using APRS?

I can't answer #1 or #2. I have some Tracker2's but no Garmin NUVI's.

> 3) For what applications do people use the Short Message Service
> inherent within APRS?

During events we use them to send short messages back and forth to coordinate. At other times some of the guys on either side of me chat back and forth in a regular QSO. I use it sometimes to send a quick note to someone new to welcome them to APRS or to suggest a tweak in their settings to put them on the map better.

If you have a Info Kiosk running (Digi_NED) you can send short messages to it and get info like where the nearest gas stations, donut shops, or ham stores are.

If you're running certain versions of APRSdos you can send satellite info out periodically as satellites are within range. I think Digi_NED can do this as well.

Be an Elmer. What an interesting idea.
I was very fortunate to have several Elmers.
Every one of us learned from those who came before us. Nobody came into this hobby knowing everything. We learned from direct guidance, reading what others have shared with us in books as well as other pages. And we learned from experimenting.

I think we all have the duty to pass this knowledge along. I feel it is bad amateur practice not to elmer.

They all go into one big pile. The T2 won't overwrite anything, but it will tend to make your favorites list a little crowded after a while. Garmin's already fixing this in upcoming releases (for other products, not the nuvi 350, alas) with user-defined categories. Incidentally that update also allows (indirectly) for timed expiration of waypoints. Unfortunately they don't have some other critical things working in that update yet, but keep your fingers crossed.

Scott

The attached email about pricing of the new Yaesu FTM-350 APRS mobile is interesting.

The FTM-350 is certainly not an inexpensive radio probably because of the amount of technology in it
nor is the VX-8 HT inexpensive for that matter.

By the way, the new Icom ID-880H FM/D-STAR 2m/70cm mobile has been reviewed in December 2009 QST.
I believe the ID-880H street price has been around $499. The street price of the IC-91AD FM/D-STAR 2m/70cm HT has recently been about $369.

For those who have been concerned about the prices of D-STAR radios the FTM-350 price demonstrates
that when you incorporate a lot of technology into a radio it increases the price.

Interestingly, many hams seem to expect that D-STAR radio prices will decrease when there is competition from
another manufacturer in the D-STAR market. However, Kenwood has been making HTs & mobiles incorporating APRS for many years
and that does not seem to have depressed the price of the FTM-350 or the VX-8.

New Yeasu Radio pricing FTM-350R

From 1 of the new guys on the list that just ordered 3

From Texas Towers. Their price should be $620.

AES and HRO are listing them at $599.95, and Universal Radio lists it
at $629.95.

Type acceptance was apparently granted by the FCC 18 December 2009

Now I have to tell Marianne (kc9jlk) That I need another Radio (Fat
Chance of this)

Looks like I'm selling my FT-8800.

i was really hoping to see the 350R come out, looked like a nice radio but come on, what a price when you look at the price of the 710. i guess i will stay with setting up my setup i'm working on and thats a Nuvi 350 gps, with a trucker2 OT2m with a 71A and that way i can have aprs messaging direct on my gps and have programing on the fly just by putting the commands into the gps. i have the nuvi 350 and trucker2 already just waiting on ordering the 71A until i get a little more money. I was thinking the 350R was going to be around the low 500.00 mark to try to beat the 710A but not no mid 600.00s that price is just crazy.

Built-in, yes. Externally accessible, no. Unfortunately the externally
accessible part is what allows you to use other APRS software clients
with the radio rather than being limited to just the functionality built
in to the radio.

You are given the option of RF Deck or Control head mounting. There is a mic jack in each.

Well, not sure why you would have to copy the short cut to your c:\ but ok, whatever works. The command should have been able to run anywhere on the hard drive. ok, so next will be running ui-view. Make sure you run it in admin mode AFTER you go to the ui-view folder and set access rights to 'read/write' . this way your map doesn't clear everytime you reload ui-view. also, you'll want to run it as admin.

All I can say is HUMBUG , it appears that manufactures listen but to they hear what is being said ?

Was there anyone within the APRS community the driving force behind this radio from the amateur radio world out side Japan ? .

It would appear that Yaesu have built this with all the bells and whistles but forgot the basics, its a bit like building a house and not having any doors or a dairy farm that milks bulls !!!!!!!!!!

By the time one orders his radio, mic ,gps and an the correct leads , freight , GST, customs we in NZ will be paying somewhere from about $1550.00 to $1890.00 NZ dollars.

Don't think we will see too many here in ZL shame !!!!

Merry Christmas to All

http://en.wikipedia.org/wiki/Not_invented_here

I've never gotten the feeling that the Japanese companies particularly
care what their Western customers want.

Kenwood does seem to have gotten better with the D710 - looks like they
took a ton of input from Bob, and they added SmartBeaconing.

I've found many Chinese companies to be very receptive to outside input
- but they want outside funding for development, and aren't always as
capable on the engineering side.

6936. remote moitoring of Voltage and Current

Yahoo group: APRS (2007 — 2010)

What did you decide to go with?

I just powered up this last weekend my first 2.8 kW array (5.6 more to go next tax year)... And I'm going to just use the standard APRS 5 channel telemetry format for my three-array system.

1 - voltage of highest array
2 - current array #1
3 - current array #2
4 - current array #3
5 - temperature of one array

I can use any KPC-3 TNC or TinyTrack for this format. I think Argent Data systems also supports the standard APRS telemetry format. My array will use a symbol S% which is a power-plant symbol with an "S" overlay (for solar).

Using similar assumptions, it will be easier to see all alternate energy systems in APRS.

Bob, WB4APR

Eventually I'll be selling the ADS-WS1 weather station without the wind and rain sensors - that might be an option for some site monitoring requirements, since it has a voltage readout. And of course temperature, pressure, and humidity.

https://www.argentdata.com/catalog/product_info.php?products_id=135

The beta test units are sold out right now, though.

I've never gotten the feeling that the Japanese companies particularly
care what their Western customers want.

Kenwood does seem to have gotten better with the D710 - looks like they
took a ton of input from Bob, and they added SmartBeaconing.

I've found many Chinese companies to be very receptive to outside input
- but they want outside funding for development, and aren't always as
capable on the engineering side.

There is a microphone connector on the RF deck and on the control head so you can connect a microphone to either. I heard some say awhile back that the FTM-350 dos not even have Corss Band Repeat mode. I found out the the FTM-350 DOES have Cross Band Repeat.

There seems to be much assumption and presumption with the VX-8R and the FTM350 radios. I know that Bob Bruninga worked very closely and was very involved it the evolution of these radios.

Write an application to monitor the Met service alerts and convert them to APRS. However, it is very important that the weather office and zone/county codes used are not the same as those used in the US, Australia, and Canada. I will be happy to help coordinate this last part with you or your software author.

From: Wayne
Topic: 6949 Message: 6949

On Charismas day a number of stations were showing up on aprs.fi with erroneous locations. They appear to back track with incorrect locations while traveling in the central Arkansas area. An example is the track of kd5ups-1. Looking at the raw packet data shows all kinds of duplicate packet errors. I have seen this condition before but it always involved station positions being igated by distant igates due to skip conditions. All of the igates in this case were local which would normally show correct locations.

I would appreciate comments on what could cause the problem.

Yahoo group: APRS (2007 — 2010)
Date: 2009-12-26 22:31:33 UTC
From: Christopher K. Greenhalgh
Topic: 6949 Message: 6952

I've seen this on numerous occasions, and there are two things going on;

As mentioned, a UI-View Digi running in KISS mode can cause random delays varying in time, and some packets ignored all together. It seems to affect a "busy" digi more than not. I had the same problem, and now let the TNC (KPC-3+ 9.1) take care of the RF side, and UI-View runs in "receive only" mode, taking care of the iGate. This is a great set up, as it still allows me to use PM8 maps, and if anything ever happens to the computer, the digi will still be fully operational.

The other is the timing of the reported packets. Somehow, aprs.fi will show a different time stamp than when it was actually broadcasted. This can be seen sometimes on mobile station, when it looks like the track doubles back, then catches up with itself. I have monitored packets from the RF side, and have confirmed the discrepancies on aprs.fi. I'm not exactly sure of the cause...it could be some sort of issue with aprs.fi, or perhaps a timing issue when two (or more) different iGate try to dump the exact same packet to IP, but I do know my RF screen always reports correctly, so I know this issue is an IP one.

From: ae5pl
Topic: 6949 Message: 6954

The KPC-3+ has a known bug that presents itself looking like extensively delayed packets in APRS when the TNC is running in KISS mode. In fact, there is much more going on but that is what the net effect is to APRS (unconnected) packets. The bug exists for both connected and unconnected (APRS) packets and has been verified via multiple software packages, users, and applications (Winlink, APRS, etc.).

From Wayne's response, their problem does appear to be an application issue but don't discount the KPC-3+ when looking at similar issues in the future.

All PSR Issues Are Now Online
By Stan Horzepa , WA1LOU

All current and back issues of TAPR's quarterly newsletter, Packet Status Register (PSR), are now online and accessible at www.tapr.org/psr
The newsletters are in Adobe Acrobat format.
Thanks to John Ackermann, N8UR, Phil Karn, KA9Q, John Koster, W9DDD, and Darryl Smith, VK2TDS, for helping to fill in the gaps in the collection.

By the way, we can automatically notify you by e-mail whenever a new issue of PSR is available for downloading by signing up here:
https://www.tapr.org/cgi-bin/mailman/listinfo/psr-announce

And we can automatically e-mail new issues of PSR to you whenever a new issue is available by signing up here:

Hi
does any one know how the ISS APRS works? I have been monitoring Findu for it and it appears to be able to find a Igate out in the middle of the Pacific Ocean, thousands of km from any known ham station. Pretty good trick so how does it do it?

Graeme

6957. How FindU gets ISS data

Yahoo group: APRS (2007 — 2010)
Date: 2009-12-29 17:38:57 UTC
From: Ozzie N4SCY
Topic: 6957 Message: 6957

```
ISS (ZARYA)
1 25544U 98067A 09357.41896068 .00014267 00000-0 90181-4 0 2295
2 25544 51.6442 54.0996 0008068 106.3741 3.8607 15.76876725635777
```

Using TLE (Two Line Keplerian Elements) from various sources, the FindU computer can calculate where the ISS is, and will be in 5 and 10 minutes. It needs no iGate to put RS0ISS on the map.

6958. Location packet information needed.

Yahoo group: APRS (2007 — 2010)
Date: 2009-12-29 18:45:14 UTC
From: Wayne
Topic: 6958 Message: 6958

Can any one tell me how to decode what I think is the location information part of the aprs transmission?

Example: 2009-12-29 11:53:54 CST:
N5NBJ-7>S4TY4Z,LTROCK,WIDE1*,WIDE2-2,qAR,WW5AA:`x0X"#$k/>"5"}442.9+T103.5EL#92130.

What would S4TY4Z decode to and how?

Thanks
Wayne, WA5LUY

Yeah, that's what I thought it might be. So seeing an update is worthless if you are trying to find the beacon. Could be around the other side of the planet for all the good it will do.
The problem is, I have tried several prediction programs (such as Orbitron) and they mutually disagree. I still can not find the station after searching for several weeks.

Then try using http://Heavens-Above.Com

It has an "Radio Amateur Satellites" menu choice. Once you go through the Gazateer to locate yourself, it will give predictions that are pretty accurate. Be sure to Register so you don't have to enter your location every time you visit.

Greetings Graeme,

For starters, look here:
http://heavens-above.com/

It has never been wrong unless my time or location has been entered incorrectly. If you can't find it with Heavens Above, then, well, I don't know what else to say but time and location must be correct.

I have compared the Heavens Above data with that generated by Ham Radio Deluxe, Orbitron, PocketSat and others and found no disagreement between the packages. They mostly use the same algorythyms to generate passes. What will be different is usually the AOS and LOS.

I use Orbitron and grab the TLEs from the Celestrak site. I use the Celestrak data to also feed my Palm M505 and PocketSat Plus. It has never been wrong! Well, actually it has been wrong; my time or location or TLEs were not current. I have been using PocketSat and PocketSat+ now for over 6 years. I have not yet bought an Apple iThingie but when I do, the first softwar package I will buy is PocketSat3.

PocketSat3 for the Apple hardware (iPhone and iPod touch) uses an updated algorythym for better accuracy. It is highly recommended and the author is quite active in the forum.
http://bigfattail.com/ <-- authors web site
http://tech.groups.yahoo.com/group/pocketsat/

Now assuming you have time, location and TLEs current and you are still not hearing anything, then check your radio system. Listen with your ear first. It is the most sensitive device going. Turn off any squelch. No signal coming down has enough umph to get over the squelch. If you are using a rubber ducky, then don't. It can add to the frustration to someone just starting out. There are simple and cheap designs for handheld yagis as well as the Arrow Antenna that will significantly improve your odds.

From the AMSAT Journals:
http://www.amsat.org/amsat-new/information/faqs/crow/JulAug06AmsatJournal.pdf
http://www.amsat.org/amsat-new/information/faqs/crow/SepOct06AmsatJournal.pdf
http://www.amsat.org/amsat-new/information/faqs/crow/NovDec06AmsatJournal.pdf

And another:
http://www.wa5vjb.com/yagi-pdf/cheapyagi.pdf

Here is a great web site to read though. There are lots of pointers:
http://www.qsl.net/kd4cga/kk5do.htm

Happy New Year!

Best regards,
Fred

Topic: 3077 Message: 6965

Greetings Don and welcome to APRS!

I'm working on a new APRS client application called APRSIS32 that you might want to take a look at. The software originated as an APRS-IS-only client for Windows Mobile cell phones with an internal GPS and unlimited Internet connection. That program is known as APRSISCE. I've since ported the code to Win32 (normal Windows PCs) as a view-only APRS-IS client application.

The part that will be most interesting to you is the soon-to-be-released version of both clients that will support NMEA GPS as well as KISS TNCs, both via serial ports which may also be BlueTooth.

Both clients use OpenStreetMap.org maps as backgrounds and will also soon support pre-loading the map tiles for a given geographical area.

So, feel free to join the APRSISCE Yahoo Group (http://groups.yahoo.com/group/APRSISCE/) to download the software and give it a go. By joining the group, you'll also receive the release notification message that will make the KISS TNC support public.

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile and Win32

PS. Oh, and with a KISS TNC and live APRS-IS (Internet) connection, the software also acts as a (currently receive-only) IGate!

PPS. You'll find the CE and 32 versions of the client along with an Introductory text file in the Files section of the APRSISCE Yahoo group (which I now notice could use a description update!).

Each program needs to be loaded with current "Keplarian Elements" or
"Keps" that describe the current orbit. These keps are available from
several sources including the ARRL. Most programs have a feature that
allows them to go to a source via the internet. Alternatively, you
can find a text file source and paste it in to the location that the
program expects to find it.

Additionally, the current location of the ISS can be accessed on
several web pages, including the iss Fan Club and NASA.

When the KISS-supporting version is released (hopefully soon), there'll be a port configuration to tell it the COM port number and baud rate for your TNC. The current version is APRS-IS (Internet) only, so it doesn't care yet.

> Thanks again Lynn
>
Enjoy browsing the program's capabilities as it stands now. All of those features and more will be in the next release, just over the RF instead of the -IS.

Yes.

It has two A-D inputs on the connectors (selectable between the radio and serial ports to suit your wiring), and a total of 5 are available if you add connections to the processor.

Command to send the data on a timed interval is TELEMTRY
Data is sent on the UNPROTO path

Jim, G1HUL

Can the KPC3+ send the battery voltage of the solar site it is on? This way I can monitor the voltage.
Thank you.

Yes, it can. Requires a little soldering.

There is a really good page that the Oregon Coast Repeater Group has put together at:
<http://www.ocrg.org/documents/newport/KPC-3+_Telemetry.pdf> and take a look at their systems documents page at: <http://www.ocrg.org/level2pages/sys_docs.html> Some other good info there.

I've got a bunch of digis up at both solar and powered sites and monitor them regularly. Between the graphing on findu or aprs.fi it's really handy. Even at powered sites it's handy to monitor the input voltage as it can give me an idea of the issue if it leaves the air, I can see if it was sudden, or if the backup battery died - indicating a power supply issue.

2 inputs are built in and easily used, but they are only 0 to 5 Volts DC. If you want to input any higher voltage, you have to install a resistor for a voltage divider.

Some things to watch out for, and that I've learned along the way:
Solar Controllers either short the panel when turning the charge off, or Open the panel.
If it opens the panel you'll see voltages quite a bit higher (for a 12V system, you can see close to 20 Volts). Build your voltage divider accordingly.
If you're putting it at a site that has temperature swings, use precision resistors. (I still breadboard my Voltage dividers for the extra 3 inputs).
I used some LM335's for temperature sensors - they work, but not very accurately. (I had them sitting on the bench at the time). The voltage regulation on the KPC3+ swings a little bit, and the resolution of the LM335 is too broad reading in Celsius, (you only have 255 points and the temperature reads in 100ths of a volt). I'll be changing those out this summer.
Set your unused inputs for a range of 0 to 0, then they will stay clean in the telemetry readouts.
Watch your jumper settings on the KPC3+, you can use either the DB-9 or DB-25 for the input pins.

You can also get a couple of Digital input readings also using the data pins. They will only report when it sends a telemetry packet. (You can't use it as an alarm input and expect to see short duration changes, but it can work well to warn you that the door has been left open, etc.).

You can see the output from some of my sites at my web page
http://aprs.n0nhj.net/solar
A few of the sites are off the air at the moment (13,000 feet in the
winter can be a challenge), so I've got plenty of summer projects now
when I get home.

I modify all of the KPC-3's I get so that I ahve all 5 channels of analog telemetry available to me. You can see how we use the KPC3's for our student labs on this page:

www.aprs.org/labsats.html

But specifically this drawing shows how I add jumpers on the bottom of the board to bring out the 5 channels to the DB-25 connector for easy access. But you dont need to do any of this if you only want to use the two pins already there.

http://aprs.org/labsats/LABSATtncMods1006.GIF

I'm working on a shunt for my home-solar so I can watch the 7 amp currents of my solar array on APRS and use the FINDU data to see how things are going.

Did you ever find an answer to this? I'm experiencing something similar with my KPC3+ and an old Standard VHF Mobile radio.

it's decoding fine, but when the TNC goes into transmit, it's like I get an error from the radio, and it's certainly not keying up.

I've checked my wiring three times, and have run through the jumper settings for the TNC and can't seem to find anything wrong with the TNC.

From the aprs.fi blog at http://oh7lzb.blogspot.com/

CWOP, Traffic view and Service status, and More
<http://oh7lzb.blogspot.com/2009/12/cwop-traffic-view-and-service-status.html>

Since CWOP (Citizen Weather Observer Program) <http://www.wxqa.com/>
users moved to their own IS server pool, aprs.fi has not collected
weather data from them. I've connected aprs.fi to the CWOP servers to
collect that data again, and the CW* stations should now show up. If you
don't wish to see them on the map, you can always hide the WX stations
in the Preferences.

I also noticed a bunch more local weather stations and knew about the
CWOP split a while back. It appears the "flood of blue" has re-arrived
at aprs.fi.

The TX circuit is a simple dry contact on pins 3 (PTT) and 6 (ground). If you're sure the wiring is correct, the only other thing that would inhibit TXing is if the receive light is on, on the TNC.

The receive light needs to be off when no packet activity is present. To set it,its best to go off frequency where you know no packet traffic is.

First set the receive level...

1. Turn the volume all the way up.
2. Open the squelch fully...the RX light should be on.
3. Turn the volume down until the RX light goes out.
4. Now slowly turn the volume back up, and stop when the RX light comes on.
5. Now turn it up just a few more degrees.

Now there are 2 ways to set your carrier detect, the first is have the radio go into detect state when the squelch is broken. To adjust that,continue...

6. Slowly close the squelch until the RX light goes out.
7. Close it just a few more degrees more.

The other method is to have the TNC "listen" for AX.25 traffic. To do this, you need to be in "terminal"mode, and set "CD" to "software"...

6. Type the command "INT TERMINAL [return]" (leave the squelch open...RX light is on).
7. Type the command "CD SOFTWARE [return]", and the RX light will go off.

Hope this info helps,

73,

-Chris

Thanks,

I was able to try to force the ID when there was no traffic, and I attempted it on a different frequency with the same results.

I will give this all a try, and see if that helps.

I connected everything as described in the KPC3+ manual, triple checked them, and I'm positive that the connections are correct.

Will try this when I get back home.

Thanks again,

Adam

The web master of the site allows this IP traffic to be imported. It s not related to amateur radio in any way, and aprs.fi allows the end user to set a filter option to "Only show stations heard over the radio" under preferences.

I wont comment on why it is done...I don't know his motive or reasoning...perhaps somebody else can elaborate on that matter.

I personally don't agree with inserting data via IP, or iGating IP traffic to RF...neither has nothing to do with APRS, nor is it in the spirit of amateur radio, IMHO. :)

my point of bringing this up is this is crazy in order to hide those weather stations you have to hide all weather stations even the ones from hams. I'm not saying these other weather stations are of no help, that would be like me saying the army is of no help. I'm just saying Citizen Weather Observer Program should be keep to their own site and ham stuff be keep to their own. now if the person is both a CWOP and a ham then great even better to be part of both worlds but to have both load on the same site come on how crazy. that would be just like me going to denver,co and clicking on show all, my runs slow as it does sometimes with loading stations and now that we have at least 10x the stations loading now my computer is trying to lock up everytime I try to load.

From: Christopher K. Greenhalgh
Topic: 6983 Message: 6993

Agreed for messaging, but there is no real benefit to well setup RF network
for anything else.

73,

-Chris

6994. RE: [APRS] a lot of new weather stations.....Delivery Program for 2010

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-04 09:00:45 UTC
From: joseph cooksley
Topic: 6983 Message: 6994

Well its like this , Santa Needs an up to the minute weather brief to avoid the worst of the snow storms on his xmas Delivery run ! So with the APRS to know where he is and the weather reporting module he then can plan the best Route to deliver further Stations Next year LOL !!!!!!!!!!!!!!
ciao

6995. RE: [APRS] Re: KPC3+ Guru

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-06 21:22:01 UTC
From: Adam Mahnke
Topic: 4821 Message: 6995

Ok, I have followed these instructions. And I had to change the RX Equalizer jumper to get the RX light to go out with the squelch fully open, and the volume all the way down. I've gotten the first 7 steps to work fine.

It receives, and the hyper terminal location is showing that it's decoding packets. However, when I try to make it ID, the TNC TX light comes on, and I hear beeping, from what I believe is the radio...

I'm thinking I may have an issue with the radio, I'm just at a loss as to where to go as the wiring has been checked. The radio is from someone else that had it working in TX just fine with a different TNC.

Any thoughts?

Adam

To: APRS@yahoogroups.com
From: chris@...
Date: Sat, 2 Jan 2010 16:54:41 -0500
Subject: RE: [APRS] Re: KPC3+ Guru

The TX circuit is a simple dry contact on pins 3 (PTT) and 6 (ground). If you're sure the wiring is correct, the only other thing that would inhibit TXing is if the receive light is on, on the TNC.

The receive light needs to be off when no packet activity is present. To set it,its best to go off frequency where you know no packet traffic is.

First set the receive level...

1. Turn the volume all the way up.
2. Open the squelch fully...the RX light should be on.
3. Turn the volume down until the RX light goes out.
4. Now slowly turn the volume back up, and stop when the RX light comes on.
5. Now turn it up just a few more degrees.

Now there are 2 ways to set your carrier detect, the first is have the radio go into detect state when the squelch is broken. To adjust that,continue...

6. Slowly close the squelch until the RX light goes out.
7. Close it just a few more degrees more.

The other method is to have the TNC "listen" for AX.25 traffic. To do this, you need to be in "terminal"mode, and set "CD" to "software"...

6. Type the command "INT TERMINAL [return]" (leave the squelch open...RX
light is on).
7. Type the command "CD SOFTWARE [return]", and the RX light will go off.

Hope this info helps,

73,

-Chris

Did you ever find an answer to this? I'm experiencing something similar with
my KPC3+ and an old Standard VHF Mobile radio.

it's decoding fine, but when the TNC goes into transmit, it's like I get an
error from the radio, and it's certainly not keying up.

I've checked my wiring three times, and have run through the jumper settings
for the TNC and can't seem to find anything wrong with the TNC.

no the radio does not appear to be going into transmit.

It's a Standard GX1500V.

I am able to key the radio with the microphone and it works fine.

I cant seem to find out what radio that is...is it a marine radio?

You say when you can key it up with the mic, I presume your removing the TNC interface, and replacing it with the mic?

If the radio is not going into transmit when the TNC TX light comes on, it is a wiring issue.

Tell me more about your TNC wiring interface...do you have a schematic?

6999. RE: [APRS] Re: KPC3+ Guru

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-06 23:44:00 UTC
From: Adam Mahnke
Topic: 4821 Message: 6999

It's a commercial VHF Radio that's been programed to 144.39.

Yes, the TNC is taken out of the loop, and replaced with the microphone.

I've attatched the service manual for the radio, and cc'd you directly. If you look on page 6-5 I believe (you may have to rotate it to get it right side up. Page 44 of the PDF) you can see the Mic wire assignments.

Useing that, along with this one.

http://www.kantronics.com/documents/kpc3ppinout.pdf

I have the Audio in from the mic (or TNC) connected to pin 1 on the DB9. The PTT on pin 3, and Ground to pin 9.

Pin 9's jumper is set to be ground. and I actually have pin 6 and 9 wired together. (I've tried it with both grounds on pin 6, and with them seperated) Pin 9 is the ground from the external speaker port. and pin 5 is the audio line from the ext speaker.

the TNC is trying to TX, but won't put the radio into TX mode.

To: APRS@yahoogroups.com
From: chris@...
Date: Wed, 6 Jan 2010 18:25:02 -0500
Subject: RE: [APRS] Re: KPC3+ Guru

I cant seem to find out what radio that is...is it a marine radio?

You say when you can key it up with the mic, I presume your removing the TNC interface, and replacing it with the mic?

If the radio is not going into transmit when the TNC TX light comes on, it is a wiring issue.

Tell me more about your TNC wiring interface...do you have a schematic?

Chris Greenhalgh, N8WCT

That radio won't TX if the mic hanger pin is grounded. It will beep. Check your wiring.

I only have 3 pins of the microphone hooked to anything.

the ground, the ptt, and the audio.

Ohm it out. If you don't know which pin is the hang up, Put ohm meter on your mic's hangup post, then look for short on mic plug.

Also you can put the TNC in CAL mode, and check for short on your TNC wire.

7009. Experimental Digipeater

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-08 17:27:51 UTC
From: vhsproducts
Topic: 7009 Message: 7009

I have posted an E-bay auction for a TT4-based experimental (yep, it actually works) digi on E-bay. Your input on the desirability of making this a permanent addition to Byonics product line would be appreciated.

7010. RE: [APRS] Experimental Digipeater

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-08 20:29:26 UTC
From: Adam Mahnke
Topic: 7009 Message: 7010

A ham buddy of mine has one of these and we used it for a special event tracker on a lead motorcycle for a bicycle ride. It worked great when there was decent APRS Digi coverage, but the 10 watts is tough in our terrain.

http://aprs.fi/?call=N2FSD-12&dt=1252713600&mt=m&z=11&timerange=3600

You're looking for N2FSD-12, on Sept 12th, 2009. Some of these plots made it to the Internet, but never made it back through the RF paths to the Net Control Station at the south end of the lake.

I believe that it had an external Antenna hooked up, and ran on the batteries most of the day. I'm not sure what was used for an external GPS.

Just FYI

Some suggestions perhaps for options would be a way to power it externally with 12V as an alternative to the internal batteries.

Adam,

I have only sent two these units of this species out to one customer, who I am pretty sure is using both as fixed, semi-permanent Digis. Your friend almost certainly had one of our MT-AIO (transmit-only) trackers. These have a separate, unregulated 12 volt input on the same screw terminal block the battery input uses, and a 6 pin, Mini DIN connector that can be accessed by (shudder) drilling a hole in the side of the case. The 6 pin din connector allows external serial I/O and power, and Byonics has a cigarette lighter/DB-9 cable. If I can find a good watertight connector to use as an external power input, I would consider adding one to the digi.

That is entirely possible. again it was last year, and I only saw it in passing. the case sure looks similar. :)

Good concept, but an external power option would be key for my interest in use for special events, we do several events over the course of the year, and several of them last for a full day.

7013. Re: [APRS] Experimental Digipeater

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-08 23:01:54 UTC
From: CaptALord@aol.com
Topic: 7009 Message: 7013

Adam,

Okay, if anyone shows any interest in our building these, I may whip up a few more and make some provision for an external power input. We ran one of these units as an event support digi and it had no problem running for the 12 hours or so the event lasted. The users were primarily beaconing every two minutes and there were about 20 active SAR people out in the field. Of course, the unit was setup as a high level digi, and it handled lots of data that had nothing to do with us. Live and learn...

That is entirely possible. again it was last year, and I only saw it in passing. the case sure looks similar. :)

Good concept, but an external power option would be key for my interest in use for special events, we do several events over the course of the year, and several of them last for a full day.

73,

Adam

Subject: Re: [APRS] Experimental Digipeater

Adam,

I have only sent two these units of this species out to one customer, who I am pretty sure is using both as fixed, semi-permanent Digis. Your friend almost certainly had one of our MT-AIO (transmit-only) trackers. These have a separate, unregulated 12 volt input on the same screw terminal block the battery input uses, and a 6 pin, Mini DIN connector that can be accessed by (shudder) drilling a hole in the side of the case. The 6 pin din connector allows external serial I/O and power, and Byonics has a cigarette lighter/DB-9 cable. If I can find a good watertight connector to use as an external power input, I would consider adding one to the digi.

A ham buddy of mine has one of these and we used it for a special event tracker on a lead motorcycle for a bicycle ride. It worked great when there was decent APRS Digi coverage, but the 10 watts is tough in our terrain.

http://aprs.fi/?call=N2FSD-12&dt=1252713600&mt=m&z=11&timerange=3600

You're looking for N2FSD-12, on Sept 12th, 2009. Some of these plots made it to the Internet, but never made it back through the RF paths to the Net Control Station at the south end of the lake.

I believe that it had an external Antenna hooked up, and ran on the batteries most of the day. I'm not sure what was used for an external GPS.

Just FYI

Some suggestions perhaps for options would be a way to power it externally with 12V as an alternative to the internal batteries.

7014. RE: [APRS] Experimental Digipeater

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-08 23:10:21 UTC
From: Adam Mahnke
Topic: 7009 Message: 7014

Thanks, that's good info... as I'm watching the auction to see what the price gets to. If it'll last 12 hours on the network, plus the high traffic of an event on just those batteries than that's a good deal.

If this has the ability to be a Digi, and a smart tracker, then I for one have a lot of interest. but as always, cost dependant.

We've actually been trying to find places for that particular event to put people with radio's capable of Digi to try and fill in around the course. I have a tower site in mind to put up a Digi that may fill in the gaps, but haven't had the opportunity to test it yet.

7017. Re: winaprs question

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-09 14:53:31 UTC
From: nk1n
Topic: 6760 Message: 7017

Hi,

I also received the fatal exception. I did not find a posted solution so I played around with the maps a little.

The error seems to ocurr when WinAPRS tries to open a Precision Mapping Window without a default map. If your PC is fast enough, you can use TIGER maps. Mine isn't. But, I downloaded the TIGER maps and set them up in the TIGER directory. Then:

- Open WinAPRS. It loads the Precision Maps and TIGER maps. On my PC, this takes a while.

- Close the TIGER maps window.

- Click the Maps menu and open a specific Precision Map. In my case, this is NYCITYLI.MAP

- Click File/Save Windows Config and save it to WinAPRS.cfg in the WinAPRS folder

- Exit WinAPRS

- Rename or delete the TIGER folder. I renamed it. I never know when I'll get a faster PC.

- Open WinAPRS. This will load only the Precision Maps and open the specific map from WinAPRS.cfg

- Ta Da!

Good Luck. I hope this helps.

Red,

I left space for a GPS on the board, but did not add the switching code or components that would allow the GPS to turn on before a transmission, so in this configuration at least, the GPS would have to be on all the time, a major power drain. Of course, Our AIO already has a GPS in the box, so I would probably get people who plan to use an external GPS handheld or mobile as their GPS (to allow them to view APRS positions) irritated with me for building in a GPS.....Maybe I could offer a GPS as an option?

If you're going to offer it I can't imagine not adding the option for a
built in GPS. That way you can please both crowds. I was just thinking
how handy these boxes would be for tracking personal during a marathon
or a bike race. Probably wouldn't need 10 watts for those type of events
so it might be nice if there was a low power option to save on
batteries. (Maybe it already has low power. If it did I didn't notice
it.) The more ways you can find to make it fit different applications
the larger your market audience will be.

Of course, Our AIO already has a GPS in the box, so I would probably get people who plan to use an external GPS handheld or mobile as their GPS (to allow them to view APRS positions) irritated with me for building in a GPS.....Maybe I could offer a GPS as an option?

I have posted an E-bay auction for a TT4-based experimental (yep, it actually works) digi on E-bay. Your input on the desirability of making this a permanent addition to Byonics product line would be appreciated.

Hi Allen

I really like the concept and idea of this digi.. not only as temp digi, but also as really local digi where the 5W from a HT like WX8R might not get you to a digi, but the 10 W on a antenna on the house will. This will allow you to move around in the troublesome area with the HT and still be heard and there would be no need for a huge setup with a PC taking a lot of power.

Now one concern going forward with this as a SAR digi, where eventually the efficiency of the operation might depend on the Digi Together with couple of fellow Ham guys in OZ land we have had not so good experience with SW APRS decoder. Among those TT4 We simply do not get all signal decoded and for that reason not repeated. It seems so that either a station makes it or it do not, the miss rate are as high as 50%... on example are my VX8R I have not really managed get the TT4 to decode and digi that.

This just a warning, so unless you control the APRS equipment used by all the SAR guys, so you have tested that it works with the digi. You might like to ensure that the decoding are similar to a HW decoder operating under the same RX condition as the SW decoder.

I run a TT4 as a W1 Digi/IGate and have isolated the non-decoding to low deviation. I've also read reports in various groups that the VX8R has very low deviation (it even sounds quiet) which would explain why the TT4 doesn't decode it.

I keep hoping to see a TT4 firmware upgrade that somehow deals with the deviation sensitivity of the DSP decoder, but have not noticed anything yet.

Richard
I use a 2720 for APRS. There is a DIN connector on the radio which is ideal for the tracker. Has all the signals you need for it.
Just remember to use the right side for APRS. The other side then can be used for whatever as main. Your tracker will interfere with your transmissions on the other side but not so much as to be a problem.

Glen-
"If your PC is fast enough, you can use TIGER maps. "
Folks who are new to the RIGER mights often mistake them for being maps.
Yes and no. The TIGER maps come from the US Census Bureau who are very loudspoken about DO NOT USE THEM FOR NAVIGATION, they are meant to be used for demographics and statistical work only. As in, "How many citizens are in this district?" and not anything that relies on matching the map up to real locations.
The TIGER maps may err, 1/2 mile to 2 miles have been reported, and the Census folks simply don't have the budget to make corrections. Every year they correct some counties, sometimes two dozen sometimes a hundred, but that's spread across the entire US and a zero priority for them. When a new road is built, sometimes they literally send someone with a car to drive down and tell them "three tenths of a mile, NE to SW".
It is not survey-quality work, it is not all WGS87 datum matched to generic GPS, it is very nice for "free" but new users may get caught unaware of that. If they work well in your area, and you've checked that out for yourself...Great stuff.

That's directly from the horse's, ergh, Uncle Sam's, mouth.

> very loudspoken about DO NOT USE THEM FOR NAVIGATION,

Please look again. They've minimized such statements or eliminated them altogether for the most recent tiger/line Shapefile datasets. I just did a run-through for the 2009 map web pages and can't find any mention of "do not use for navigation" statements. Those statements probably exist for pre-2008 and maybe the 2008 datasets, but I started at the 2009 pages.

The U.S. Census Bureau received a ton of money for updating the datasets and improving their quality, because various organizations and people were relying on their data for mapping purposes.

So... Revisit this topic to see how they've improved their data and please report back if you find statements about their latest 2009 data such as you described. I started here:

http://www.census.gov/geo/www/tiger/tgrshp2009/tgrshp2009.html

The closest I can find to that statement now is just a standard legal disclaimer:

"1.6
TIGER/Line Shapefile Legal Disclaimers
No warranty, expressed or implied, is made with regard to the accuracy of the data in the TIGER/Line Shapefiles, and no liability is assumed by the U.S. Government in general, or the Census Bureau specifically, as to the positional or attribute accuracy of the data."

BTW: We use both the Tigermap server (old data, 1998?) and downloadable Tiger/Line Shapefiles for Xastir, and have done so for years. We've read their disclaimers for years too. In the last few years they started changing their statements from generic "do not use for navigation" statements, to specific statements about the accuracy of various parts of their data. In other words they are starting to think about their dataset in GIS terms, which is great! In the Acknowledgments section of their big PDF they even have:

"Special thanks to the Core Update Software Branch and Geographic Process and Quality Management Branch of the Geography Division for their role in the quality control."

I also found this in their big technical document:

"2.1.2
Census 2000 Geography
Census 2000 geography is the geographic extent of legally defined geographic areas or statistical areas in effect on January 1, 2000. This vintage enables users to work with Census 2000 data using boundaries as they existed in 2000. Since 2000, the Census Bureau initiated significant operations to improve the coordinate accuracy of our geographic database-the MAF/TIGER Accuracy Improvement Project or MTAIP. The MTAIP modified the base coordinates of virtually all the features in the database, thus the representation of Census 2000 geography will not match the representation depicted in the Census 2000 TIGER/Line files. The inventory and attributes of the 2000 census geography is, however, unchanged."

And this:

"In addition, the All Lines Shapefile also contains a Spatial Metadata Identifier (SMID), which identifies the source of the coordinates for each edge and provides the link between the TIGER/Line Shapefiles and the source and horizontal spatial accuracy information. Refer to the metadata for each county or equivalent entity for information on the source for each edge and the horizontal spatial accuracy, where known. Please note that the horizontal spatial accuracy, where reported, refers only to those edges identified as matched to the source with that accuracy. It is not the spatial accuracy of the TIGER/Line Shapefile as a whole. For more information regarding the All Lines Shapefile please refer to Section 4.4, All Lines, Spatial Accuracy of Linear Features (pg. 4-20).
TIGER/Line Shapefiles are a product of the U.S. Census Bureau and as such contain metadata that comply with two standards: the Census Bureau Geospatial Product Metadata Standard (GPMS), and the Federal Geographic Data Committee (FGDC) Content Standard for Digital Geospatial Metadata (CSDGM). The Census Bureau created the Geospatial Product Metadata Standard (GPMS) which includes metadata elements from the FGDC CSDGM and the International Organization for Standardization (ISO) metadata standard: ISO 19115."

Section 4.4 has a "Spatial Accuracy of Linear Features" subsection. That entire section is worth reading.

Again, I didn't find any such "do not use for navigation" statements describing their latest dataset, but if you do, please let us all know. Thanks!

Hi Allen

I do not want to OT on this one, so a final from here.

Good to hear that you have solid decoding on the tt4. And will do the test with VX8R, that indeed do have very low deviation from the modem (I have tried to adjust is higher in the services menu. But the setting was generic for deviation, not modem specific and did not do much improvement)

We have tried the TT4 on 5 different radios using both the output from the headphone as well as the discriminator output on the modem connection (ACC connector) on the rear of most radios. We see consistently the TT4 decoding less packet then our alternative… In my case the TNC build in to the TS-2000 or a AEA PK12 modem. I seem to be able to plug in the PK12 in almost anywhere and then is just running and doing it´s thing. If I use monitor on the tt4 I read some 35 from the VX8, most other stations are between 60 and 80, some are starting and ending in the 80 range but in between are more in the lower 70. From the LMR radio I planned to use for my TT4 digi I do run with out squelch so with no signal, monitor are showing 110- 113 I believe. Putting the PK12 on that radio decodes everything.

Properly the two of us here in OZ land (I did refer to the Prefix of our call = Denmark , but I can see that was unclear) have been doing this wrong for now and will continue to work on getting it working.

And yes if a FA version will be available at this year Dayton, we just might bring home one, as we last year did bring home from Dayton both the fine product of AOI and the 8000FA

Hi Allen

I do not want to OT on this one, so a final from here.

Good to hear that you have solid decoding on the tt4. And will do the test with VX8R, that indeed do have very low deviation from the modem (I have tried to adjust is higher in the services menu. But the setting was generic for deviation, not modem specific and did not do much improvement)

We have tried the TT4 on 5 different radios using both the output from the headphone as well as the discriminator output on the modem connection (ACC connector) on the rear of most radios. We see consistently the TT4 decoding less packet then our alternative… In my case the TNC build in to the TS-2000 or a AEA PK12 modem. I seem to be able to plug in the PK12 in almost anywhere and then is just running and doing it´s thing. If I use monitor on the tt4 I read some 35 from the VX8, most other stations are between 60 and 80, some are starting and ending in the 80 range but in between are more in the lower 70. From the LMR radio I planned to use for my TT4 digi I do run with out squelch so with no signal, monitor are showing 110- 113 I believe. Putting the PK12 on that radio decodes everything.

Properly the two of us here in OZ land (I did refer to the Prefix of our call = Denmark , but I can see that was unclear) have been doing this wrong for now and will continue to work on getting it working.

And yes if a FA version will be available at this year Dayton, we just might bring home one, as we last year did bring home from Dayton both the fine product of AOI and the 8000FA

Michael,

The RF section that the unit uses (currently only on the North American frequency) does not do any of the cute audio processing tricks that voice comm radios do, i.e, noise filters,CTCSS-cut filters, band-pass filters, compression/compandoring, and high levels of total harmonic distortion that a high power, but low quality audio amplifier of the type used in most ham gear introduce. Just fresh, unsquelched audio right out of the detector. In side by side tests, I get the same level of decoding from this configuration (our MT-TT4) That I do from an Icom 706MKII G and AGWPE (which is a very tolerant decoder of weak and sludgy signals) The TT4 can certainly out perform the old TELCO 1200 Baud modem chips, which required a near-perfect signal. This digi is basically a high-power version of our MT-TT4 (1/2 Watt transceiver) and we have never had complaints of inability to decode signals, so I am confident that we are in good shape on this score. If your TT4 can't decode your Yaesu, I would first suspect your settings (especially the RXAMP setting) and the audio quality from your radio. Run unsquelched audio if possible. Try it with the volume as low as possible and adjust the RXAMP setting up until you hit decodable ranges. I would expect that version 2.0 of our MT-TT4 based products would be frequency agile. Producing the MT-AIO and the MT-8000 FA as frequency agile units was very much the result of demand from Australia (and to a lesser extent, Europe) I look forward to your being the first user down under to field test the frequency agile version! I will make double-dog sure we can decode the VX8R, which to me seems kind of finicky piece of kit!

Hi Allen

I really like the concept and idea of this digi.. not only as temp digi, but also as really local digi where the 5W from a HT like WX8R might not get you to a digi, but the 10 W on a antenna on the house will. This will allow you to move around in the troublesome area with the HT and still be heard and there would be no need for a huge setup with a PC taking a lot of power.

Now one concern going forward with this as a SAR digi, where eventually the efficiency of the operation might depend on the Digi… Together with couple of fellow Ham guys in OZ land we have had not so good experience with SW APRS decoder. Among those TT4… We simply do not get all signal decoded and for that reason not repeated. It seems so that either a station makes it or it do not, the miss rate are as high as 50%... on example are my VX8R I have not really managed get the TT4 to decode and digi that.

This just a warning, so unless you control the APRS equipment used by all the SAR guys, so you have tested that it works with the digi. You might like to ensure that the decoding are similar to a HW decoder operating under the

same RX condition as the SW decoder.

Thanks Red,

I didn't know that. I don't plan to use them for navigation. They are just "prettier". For me they provided a way to circumvent the unhandled exception error that I ran into. To use them permanently costs CPU cycles that I don't have. My PC is only 233 MHz.

Thanks again - 73

Glen-
"If your PC is fast enough, you can use TIGER maps. "
Folks who are new to the RIGER mights often mistake them for being maps.
Yes and no. The TIGER maps come from the US Census Bureau who are very loudspoken about DO NOT USE THEM FOR NAVIGATION, they are meant to be used for demographics and statistical work only. As in, "How many citizens are in this district?" and not anything that relies on matching the map up to real locations.
The TIGER maps may err, 1/2 mile to 2 miles have been reported, and the Census folks simply don't have the budget to make corrections. Every year they correct some counties, sometimes two dozen sometimes a hundred, but that's spread across the entire US and a zero priority for them. When a new road is built, sometimes they literally send someone with a car to drive down and tell them "three tenths of a mile, NE to SW".
It is not survey-quality work, it is not all WGS87 datum matched to generic GPS, it is very nice for "free" but new users may get caught unaware of that. If they work well in your area, and you've checked that out for yourself...Great stuff.

That's directly from the horse's, ergh, Uncle Sam's, mouth.

Do you use flat discriminator audio?

My TT'4's decode VX-8r's with no problem. I use MastrII's and BK EPH's all hooked to speaker audio. AC level of valid tones .5v RMS max. RXAmp 13 CDLevel 13, CDMode tones.

My VX-8 is a little low in dev, but not enough to cause problems at 1200 baud.

It sends out packets at +-2.50Khz in normal FM, and +-1.25Khz in half deviation mode. Most folks recommended a level between 3.0 and 3.5Khz. So it's about a half Khz low.

I actually use the VX-8 when setting mountain top Digi RX levels. If the Digi will decode the VX-8 in both normal and half dev, in addition to +-4.5Khz from my vehicle. I know the Digi decode is set well.

The wave form looks clean. High tone is 2.5KHz, and low tone is around 1.5Khz. I don't have any problems getting decoded by any Digis, including: KPC-3, KPC3+,9612+,AGWSoundCard, UIDIGI, OT2, and TT4's.

I think the VX-8's lower dev level could increase decode problems when it's RF signal is weak into a digi, noise definitely affects the ability to decode low deviation.

Voice modulation can exceed +-5Khz when the mic level is set above mid range, however the mic level adjustment doesn't affect TNC levels.

When the VX-8 is set to 9600 baud it exceeds +-5Khz, it's about +-8Khz. The have dev setting has no affect on 9600 deviation.

There is a 144 Mhz max dev tech adjustment from the keypad, but after turning it up the voice dev is too high, unless the Mic Gain setting was lowered from 3 to level 1 or 2. The keypad tech alignment procedure could easily mess up many radio settings, So I don't recommend it.

Alan

Wait a minute... Are you saying that you looked at the TigerMap
server and the maps are just as they were 10 years ago? That server
actually uses data from 1998, so it's more like 12-year old data!

That's not the data we're talking about though: We're talking about
the Tiger/Line data in ESRI Shapefile format. You need a GIS
program or an APRS program to read them in before you can produce
maps.

Mark,

The D710 can mate with a Garmin Nuvi 350 using the Fleet Management Interface (FMI. You use a GTRANS cable wired for the D710 from Argent Data.

TT4 decoding.
Actually we thoroughly tested the MT-TT4 (TT4 combined with a micro transceiver).

We compared it to a TH-D7 kenwood HT which we use as a kind of standard, since it was the only fully intergrated TNC/Radio on the market for the last 10 years until recently and we have found that it can reliably decode at -117 dBm Which is only 5 dB above the 10 dB SINAD of -122. (about 3 dots on the LCD signal strength meter).

We found that he MT-TT4 was within 1 dB or our ability to discern compared to the TH-D7 so we were very pleased with this result. But, in our initial version of the MT-TT4 we found that we had to add 3 1uF bypass caps at each of the major chips to get the RF environment quiet enough to see that sensitivity.

TT4 decoding.
Actually we thoroughly tested the MT-TT4 (TT4 combined with a micro transceiver) .

We compared it to a TH-D7 kenwood HT which we use as a kind of standard, since it was the only fully intergrated TNC/Radio on the market for the last 10 years until recently and we have found that it can reliably decode at -117 dBm Which is only 5 dB above the 10 dB SINAD of -122. (about 3 dots on the LCD signal strength meter).

We found that he MT-TT4 was within 1 dB or our ability to discern compared to the TH-D7 so we were very pleased with this result. But, in our initial version of the MT-TT4 we found that we had to add 3 1uF bypass caps at each of the major chips to get the RF environment quiet enough to see that sensitivity.

Mark,

The D710 can mate with a Garmin Nuvi 350 using the Fleet Management Interface (FMI. You use a GTRANS cable wired for the D710 from Argent Data.

After Bob B. did his tests, I started hunting for the noise source, and it appeared to be noise from the 20 MHZ clock making its way into the TT4 audio path. I changed the value of the .1 MFD capacitor near pin 32 of the TT4 to a .47 electrolytic tantalum. All MT-TT4's sold since Bob's test already have that cap, but adding the 1 Uf caps to the Max 232 (pin 16) and the Atmega (pins 10 and 30) certainly won't hurt!

Hi Alan

Yes we have been using both Discriminator output and also Headset output, actually the only time i managed to get a few packets decoded by the TT4 from my VX8 was using the headset output from my TS-2000 with the RX equalizer off using a squelched signal.
The professional LMR that have been modified to APRS are indeed Discriminator output unsquelched with a 100mVRMS output, now i know that Byon told me that he believe that a 1vpp signal are required for the TT4 to work, but input signal level are no where specified.

Also using the ACC connector on the back of a FT-8100 using the 1200 Baud output data pin. To achieve the specified level using monitor in the TT4 i have between the different radios been using RXamp value between 15-18 to get between 60 an 70 in monitor and a average of Packets. (There seems to be a discrepancy in the TT4 documnetation if the level on signal receive in monitor should be 60-70 or 70-80)

Michael,
I use the TT4 "Built", latest firmware, had pretty good luck with decoding discriminator on an ICOM R-8500 100mVRMS. It decoded weak sigs better from the speaker port, or the fixed audio from the tape recorded port.

1 vpp was too hot for me, the TT4 DSP likes a lower level than any of the other TNC's I've played with. I set the level with 1khz tone at 3.5Khz dev. Set level from 100mVRMS to about 500mVRMS max. Best all around decode was around 300mVRMS, with RXA around 13.

Since the monitor level moves up and down with the RXAmp setting, squelch open, raise volume until it hits the max reading, then back it down by about 5 or 10. So if the max monitor value is 103 with noise, I lower volume down to about 93. Valid tones are decoded from about 15 to 90. Good quick way to set the volume level.

As I recall when I had a TT4 on fixed discriminator I set the RXAmp up a little higher, like 15 to 20 RXAmp. I always use CDMode tones, with squelch open. No squelch delays, or battery saver delays when hooked to hand held radios.

Cheers,
Alan

Hello to everyone,

I dusted off my th-d7a when I purchased a vx-8r and installed it in the mobile. I was wondering if it is possible to use the th-d7a as a digipeater to pass my location when I am going hiking with my vx-8r.

Thank you
Jason

Not with the internal TNC. See the note on page 72 of the manual. You could use an external TNC though.

Thanks for the reply Larry. I gues then I could connect my th-d7a to my kam-xl, another peace of equipment that was collecting dust. I will have to do some research, I haven't played with the d7a or the kam-xl in a very long time.

7052. Wanting to set up an IGate in far SW MO

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-17 04:02:42 UTC
From: Ray Brown
Topic: 7052 Message: 7052

Howdy, everyone. I have access to a nice, high antenna system and
a Kenwood D700 to hopefully run an IGate with. When set to 144.39,
the display is showing traffic on our nearby I-44. The antenna is a good
100' AGL and in regular mode it works repeaters 60 miles away.
(It has a 100' run of 1 5'8" hardline to keep the loss down. :-)

I had an IGate running at home before but the PC died. However,
I still have a license for WinAPRS, which I can use. But I'll be able to
put a PC in the room where the D700 is and connect it to our WiFi. :-)

What would be the ideal setup to get it up and going as a?

Thanks!

Ray, KB0STN

The D700 internal TNC does not have a sufficient buffer to act as a bidirectional IGate. It will cut off portions of transmitted gated packets when they exceed a certain length. This causes the payloads of third-party (gated to RF) packets to loose some or all of the third-party header rendering the packets useless and causing the IGate software to misinterpret the packets if they are digipeated (seen by the IGate as different packet types).

The Kantronics KPC 3+ should also not be used if you use KISS mode as it exibits a bug that can delay packets on the order of minutes by seeming to become "confused".

Hi Peter

Please explain that in more details... I can not see why it should not as a Igate or Digi when hooked up in Kiss mode to a pc running UI-view. UI-view are doing all the work and the D700 only act as a simple Kiss Modem with build in Radio ???

Very simple. Every packet must be buffered before sending, even in KISS mode. If the send buffer is only 128 bytes (which is more than the D700 has), the packet will not go out properly. In command mode, this causes the data portion to be partially lost. In KISS mode, this causes improperly formatted AX.25 packets. Gated packets are naturally longer than originated packets because of the extra header information.

The D700 is a great standalone APRS radio or a great radio to use with an external TNC. Its design precludes its internal TNC from being used for much of anything else.

If you intend to use KISS mode, to not use a Kantronics KPC 3+ either due to the KISS mode bug in that model of the TNC (all firmware versions).

Hmmm... you'd think that Kenwood would want this radio to be one of the best,
and RAM is so easy to address and drop in.

I don't suppose that there's a RAM chip available for the D700?

Otherwise, it's a PC thru the serial cable, right?

Hello!

I have a Kantronics KPC3+. And i have it working as a Digipeater with a Ericsson C600 on 144.800 and yesterday the KPC3+ just died.

When I tried to communicate with it nothing happened. Then I reset it by the jumper and now I can set baud rate and

then it want the callsign and when I push enter the KPC3+ hangs. And if I reset it all start over again.

And if I try to do same thing whiteout memory battery it starts then I can enter signal and then it says cmd: and if I

write intface terminal or help etc. the KPC3+ answer EH?. And every 10 second it shows the welcome screen.

Is it CPU defective?

(When I do reset the self test says the everything is OK)

Subject: [APRS] KPC3+problems.

Hello!

I have a Kantronics KPC3+. And i have it working as a Digipeater with a Ericsson C600 on 144.800 and yesterday the KPC3+ just died.

When I tried to communicate with it nothing happened. Then I reset it by the jumper and now I can set baud rate and

then it want the callsign and when I push enter the KPC3+ hangs. And if I reset it all start over again.

And if I try to do same thing whiteout memory battery it starts then I can enter signal and then it says cmd: and if I

write intface terminal or help etc. the KPC3+ answer EH?. And every 10 second it shows the welcome screen.

Is it CPU defective?

(When I do reset the self test says the everything is OK)

Christopher,
try this,take off the battery ,
with one figer push the connector of ground of the battery receptacle like
if you did a short circuit,
turn on the kpc3 a couple a second,,,
it should reset the kpc3,dont forget to put the RESET jumper ON,too.
after ,refix the NEW battery ,take off the RESET JUMPER.

try to communicate with it,at the first prompt set the baud rate at 9600
After that tell him your call MYCALL,,,,,,,

let us know how it did ,,
i had one day the same problem,,it is like it took a bad headache and need
to be HARD RESET

at least it worked for me

When you take it apart, look at the BLACK caps near the power conenctor. if they look swollen, they are bad, and causing your problem.
Mine were and would hang over anything. Replaced myself for 4 bucks.
still working to this day

Maybe the hard reset would work, but, look over your caps just to be certain.

7063. APRS help

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-19 01:38:58 UTC
From: Mike Short
Topic: 7063 Message: 7063

I have a bunch of stuff and want to lash it up and see what I can do.

I have:

Kenwood TH-D7 HT with TNC

TNC-X with USB and X-Track

Byonics MT-300 and GPS receiver

Garmin Nuvi 350 with FMI cable and cradle/power.

Two Magellan Map 410's and one data cable.

Several HT's, and an Icom 2710h.

Couple of laptops.

I would like to set up something at the house to view APRS data/maps, etc.

One or more trackers for vehicles/portable use.

Help.

Mike

Also try these commands
E on (echo on)
LF on (Line feed on)

This might help.

From: Alan
Topic: 6972 Message: 7066

My Solar digi is setup Fillin, only responds to fresh first hop mobiles running WIDE1-1,WIDEn-N. Ignors all the stale commercials.

It transmits about once every 11 minutes. Plan to reduce to 4 times an hour, with no path.

The Byonics TT-4 has low current draw, LED disable, reports voltage and temp, and requires less audio drive level than others. A Bendix/King EPH portable set to low volume 250mv rms, open squelch, 5 watts RF. Light load on the system.

The latest OT-2 has similar features, and improved decode.

Works well,
Alan

From: vu2yep
Topic: 7068 Message: 7068

Hi All

Greetings from New Delhi, INDIA.

I am new to this group,I am a ham radio operator, call sign VU2YEP.

I am looking for help with regards to choosing a USB type LCD based Personal Navigation Device (GPS with Display usually installed in Cars) or possible devices available in the market.

Hams and people who are using them with their respective APRS setups like encoders, specially in mobile setup to monitor APRS activity in around them depending on the availablity of the map in the GPS (PND) system.

I looking forwad for information on the above popular GPS devices (Nuvi, Garim, Magellen) which can easily connected to trackers like 'Tiny trak 4' or Urgent Data's 'Open tracker+' or 'Tracker 2'.

Group waiting for your kind response. You can also respond to me direct incase don't wanna spam people's mail boxes..lol

Regards

Karan, VU2YEP

The 11 minutes is about right. The net-cycle time for local direct real-time info is 10 minutes. Of course a fill-in-digi is doing this 24/7, but on the other hand, if it is truely a valuable asset at th is location, then it is expected to show itself evry 10 minutes LOCAL DIRECT so that new users in the area will see it.

I tend to like for network assets to follow the standards of beacon timing so that users can have consistent expectatios about local info update... IE, monitor for 10 minutes and everything you need to know about a local APRS network should appear.

Remember, this only applies to local DIRECT (no path) packets. ANything via a digi is expected to be at 30 minutes.

Bob.

Hi,
I don't believe this model of Garmin is configured for FMI, and it doesn't output NMEA sentences. In other words, it is likely that this model won't help with APRS.

You need to look at Garmin models which output NMEA directly or look here:

https://www.argentdata.com/catalog/product_info.php?cPath=28&products_id=114

this link shows a cable made to interface specific Garmin FMI-enabled RXs with the 710 (it is a Garmin to NMEA converter cable in reality). The most popular of these models is the Nuvi 350, which doesn't suffer from the "breadcrumb" issue that the other GPSs in the list under the link have. Note that these models are all discontinued. The 350 is still available either used or refurbished, but they are all being bought up. You can look in the 710/71 Yahoo group as well.

I use a Garmin 276C in conjunction with my 710.

I think the answer is you can't.

I've just PXed my D-700 for a D-710 and bought an AVMap G5, which will work together.

I had bought a Garmin 765T recently, but it is rather poor. I guess your 755T will be the same.

The 765T was my 4th Garmin and probably my last Garmin as Garmin appear to have 'lost their way'. Now only interested in the 'eye-candy' kids. The new features on the 765T are a downgrade from an earlier Garmin, disappear from the screen before I've had time to read it or just fail to work correctly.

Reg

Agreed that the AvMap is a great solution, but it is very expensive. Granted, it does support tactical mode, but otherwise the cost is too high, IMO, for that feature, APRS icons, as well as a pre-made cable. I would have purchased it at one point if it had cost around $400.

Garmin could have owned this market if they chose to write code to fully support APRS. Alas, no.

Since then I started using the 276, and I also use it to receive XM weather and it also serves as my XM radio tuner (via the GXM 30 external antenna). In this way I was able to make my dashboard area less "busy".

I can send email to WLNK-1, The person I send it to gets the message.

I am not getting "ack"

I am not getting the message when I list "L" or read "R1" -- it does show on the aprs message list (see below) as being sent.

Am I doing something wrong? Or is the "sending" station not sending the message to me? I also set my message filter to "*" to see if I would see the message - none. I do see everyone else's messages.

I use a Nuvi-755T in one of my vehicles. Hooked to an OT2. The 18 pin cable works with the OT2. It won't display objects, or waypoints, but I can program the OT2 and send/receive messages from the nuvi-755T.

For your application the 18 pin cable should be able to supply NMEA to your Kenwood, nothing else. No waypoints or other communications with the Kenwood. You would also have to wire up the cable to plug into the kenwood interface.

If you use the FM receiver traffic service the 18pin cig lighter plug doesn't have the FM receiver, so the traffic service won't work.

18 pin connector:
https://www.argentdata.com/catalog/product_info.php?cPath=28&products_id=91

http://groups.yahoo.com/group/tracker2/

I Don't know if the 755t side USB connector will work on the 755
http://wiki.argentdata.com/index.php/GTRANS

Compatible cables
http://wiki.argentdata.com/index.php/Garmin_FMI

Nuvi cables

Try AU on (auto linefeed)

Do you use a USB to serial adapter?
Try changing baud to 9600.

I have seen this problem. In my case it wasn't the TNC. it was serial setting in my terminal program that kept it from displaying commands.
It would respond Eh?. Try changing settings in your terminal prog, or try a different term prog. I think the ASCII settings needed to have local echo turned on, and increase line delays, like 10ms. Once I was able to send commands, I was able to turn on:
E on
LF on
AU on

Try Teraterm and hyperterminal

Good luck,
Alan

>The 765T was my 4th Garmin and probably my last Garmin as Garmin
>appear to have 'lost their way'.

Garmin still has their marine navigators/chart plotters, which will
have to output NMEA, in order to talk with autopilots and maritime
VHF transcievers.
Street navigation GPSes, however, normally wom't need NMEA, except for
folks like us :-)
I use a GPSMAP 276C with a TM-D700 in my car.

7080. RE: [APRS] dog tracker

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-20 22:35:56 UTC
From: Christopher K. Greenhalgh
Topic: 7076 Message: 7080

Interesting idea.

The Astro transmits in the MURS bandwidth (151-155MHz), but I don't know what mode. Ill also bet its not x.25 data format either...prolly some pripiatary format knowing Garmin. You would also have to address timing and transmit issues as well.

You best bet would be to make an APRS collar with existing amateur hardware/protocol, and use a web based phone to track it...that is, if the collar could hit an iGate. If not, you could rig up some sort of portable receiver interfaced with an FMI capable GPS.

i know this has been talked about before but just an idea. has anyone ever took a Astro DC 30 Wirelesss Collar Transmitter and changed it for aprs use. changed the freq from murs to aprs or even 145.05? this just has me thinking.

Has anyone done a comparison of the FT-350 and the D710? I would like to see a chart or table listing features and whether or not each has the feature. I don't own either, but am trying to decide which to buy when I can afford one. If nobody has such a comparison, perhaps I'll make one.

>

I do not own either radio, but one of the big differences that I've learned in my list reading is that only the D710 has the ability to do APRS on one side with simultaneous voice on the other side and it will automatically hold off the APRS transmissions while transmitting on the voice side. When the key is released on the voice transmission, the APRS side burps out whatever was pending so as not to interrupt a voice QSO.

Every other dual-bander seems to require the operator (that means YOU) to remember to do something to make the APRS not conflict with the voice side and also to avoid accidentally beaconing on the wrong side. Basically, the way I understand it, is that there's only ONE active transmit side so when doing a voice QSO, you basically have to shut down your APRS tracking.

I'm willing to be corrected on this understanding as I'm still shopping for an APRS-friendly dual-bander.

7083. FT-350/TM-D710 Comparison

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-21 19:28:03 UTC
From: Lynn W. Deffenbaugh (Mr)
Topic: 7081 Message: 7083

This was just (talk about timing) posted on the opentracker list so I thought I'd copy it into this thread in response to k37vin's query.

-------- Original Message --------
Subject: Re: [opentracker] Re: Mic Encoder Question
Date: Fri, 22 Jan 2010 07:46:30 +1300
From: The Simpsons <grant@...>
Reply-To: opentracker@yahoogroups.com

I use the Mic-E feature. I hadn't replied earlier as the thread seemed to be more about HT operation though.
I use it on my Kenwood TMV71A in my mobile. APRS here is on VHF and most of my operation is on VHF so I wanted some way of using the same radio for both APRS and voice without any interaction problems. I chose the TMV71A as it can easily use APRS on one side of the radio independently of the other side (which I use for voice).
When using voice, I didn't want the APRS to transmit part way through a voice transmission or when receiving a voice reply. I did want it to send the position reports reasonably often though. Mic-E allowed me to prevent the attempt at transmission while I was transmitting but commanded the OpenTracker to send the position on release of the PTT and before the other party started transmitting.
I mixed the audio from the voice side of the radio with the audio from the data connector to the OpenTracker so it would not transmit while there was voice being received. This is sensitive to level so if the voice level is a bit low it will not be detected by the OpenTracker.
When monitoring at low audio levels, the tracker operates normally but if carrying out a conversation with audio level somewhat higher, or the PTT is pressed there will be no data transmission. When transmission does occur it's on the APRS frequency and never the voice frequency.
The Mic-E feature was one of the reasons I bought the OpenTracker and being able to choose which side of the radio is used for the rear DIN input for data independently of the voice operation is why I bought the Kenwood in preference to the Yaesu FT8800 (which I already had in another vehicle).
I couldn't use a separate radio for APRS as there is no room for that in the Mazda MX5 (Miata) that I use this system in.

Really?

I too, do not have a D710, but if this is true, its a step backwards from any other quality dual-band radio.

All the ones I have owned, allow for simultaneous use of each band. Cross band repeating is a common feature on dual-band radios, IE; RX *or* TXing on the VHF side, while simultaneously doing the same on the UHF side.

Maybe somebody can clarify for sure?

This is true for U+V and V+U, but V+V is a different challenge. And the point I was making is the automated nature of V+V operation where APRS operation is on one of the sides. Other V+V radios (and, I believe all dual-banders) only allow one side to be "active" for transmit. Otherwise, which side would it transmit on when you PTT? With a single "active" side, either APRS works OR the microphone and voice works. The D710 (as I understand) allows one side to be dedicated to APRS while the other side is active for the operator. APRS will wait to transmit until the operator releases PTT at which point the APRS burst goes out on the APRS frequency.

With a single active transmit side in other V+V radios, if you switch the active status to the voice frequency, the APRS function will end up transmitting on the wrong frequency or not transmitting at all until you switch it back.

Ah, I follow now...

Like I said, I don't have one, and while I'm sure there is a TX "active side" selection from the front, it does have 2 data sockets in the rear that might be able to separately control the two PTTs. But as you mentioned, there would have to be some timing/delay function when doing V+V.

I've used an Opentracker with a 15-year-old Kenwood TMV7A for the past several years. I have the left side set as the DATA band and the OT connected through the 6-pin mini-DIN DATA jack on the RF deck. Regardless of whether the right side is set for VHF or UHF operation the radio always routes OT audio and PTT to the DATA band because of that (DATA) setting. If the OT asserts a PTT while I am transmitting on either band on the right side it will be ignored. Not queued, just plain ignored.

I use a TM-710.

With the APRS setup on "A" side and usually running UHF on the "B" side.

Sitting still and talking doesn't seems to interfere too much, but if I
am moving with SmartBeaconing on and PTTing, I notice some empty
position spots on the maps then if I wasn't transmitting when comparing
same routes.

I know of no VHF/UHF dual band radio with simultaneous transmit on both sides -- attempting to do so would be technically possible in theory but worse than useless in practice.

7090. not getting APRS messages - TM-710

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-22 14:37:15 UTC
From: Stephen M. Shearer
Topic: 7090 Message: 7090

I am not getting APRS messages to my Kenwood D710. I was getting messages -
can't find anything changed. First noticed I was not getting winlink reply.

I am getting group messages.

I can go to the internet and check my messages - and can see they were sent.
http://aprs.fi/?c=message <http://aprs.fi/?c=message&call=WB3LGC>
&call=WB3LGC

Any ideas?

From: Patrick Domack
Topic: 7081 Message: 7091

I don't think any of this has answered his question at all. He wanted
to compare the ftm-350 to the tm-d710.

The ftm-350 is not just another dualband radio that needs a
tracker/tnc added to it. It has aprs built in like the tm-d710. So it
should be able to act like the tm-d710, assuming they made it do so. I
haven't use the ftm-350 yet, so I can't really comment on exactly how
it does function.

The only thing I can really do to help is this crosspost from the
yaesu_ftm-350 yahoo group:

By commlt <af6gl@...>:

There are so many nice things I think I will need to start going
through the manual page by page and take notes. I will be honest up
front, I do not have the time to do an in depth review but I will do
my best. One thing I am excited about are some of the APRS
enhancements - I hope they are all included in the VX-8D update.

Smartbeaconing is nice but you also have a lot of choices to turn on
and off all the numerous beeps and musical notices it uses. One thing
I really like is you can turn the ringer on for a list of eight call
signs and ssid's. I have mine set up where it rings three musical
notes when it receives a beacon from someone on your list. You can
also set it up if someone enters within a user specified distance from
you it also rings(if some of this is not new to other units forgive
me, I am upgrading from a D700).

Many radios can transmit on VHF and UHF simultaneously but everyone here is talking about having both VFOs on the radio set to VHF and then whether the radio can sort out which VFO gets to transmit via which control method.

But, for sake of completeness, the D700, D7 (HT), and D710 (I own the first two) are all fully capable of simultaneous transmit with one VFO on VHF and the other on UHF.

Yes, all dual band radios have just one PA, however, it actually would be
quite easy to accomplish.

>but worse than useless in practice.

Sorry, I don't understand that statement.

WLNK-1> <http://aprs.fi/?c=message&limit=&call=WB3LGC> WB3LGC: 1) 01/22
10:28 D710 394 bytes

If I send to winlink to get my messages [L] - I never see the "1) 01/22
10:28 D710 394 bytes" message

I AM sending the message to winlink OK, as web sees it and the reply to me,
I just don't get the reply.

I did a reset and reloaded the settings.I noticed that even though I did a
FULL reset, the message number didn't get reset.

And I am sending DUPE messages (as I see no ACK)

2010-01-22 16:20:24 EST: WB3LGC <http://aprs.fi/?c=raw&limit=&call=WB3LGC>

Subject: RE: [TM-D710A] not getting APRS messages - TM-710

Hi from Vancouver Canada

I check my D710A fairly regularly (cycle through repeaters and APRS). I send myself messages to test the text mail capability. Have you set the parameters correctly? A silly question but being IT I usually start with the basics:

TO: EMAIL

[destination email address here] (space) test xmt test xmt (or what is being sent)

Then send it it off. You should receive an email from the APRS email handling facility. If the email isn't set just right, it won't land on the receving

servers. I've cycled text messages and they've landed within about a minute of being sent.

But another question to ask is -- has anyone found out if a keyboard is available? There was for the D700.

I am not getting APRS messages to my Kenwood D710. I was getting messages - can't find anything changed. First noticed I was not getting winlink reply.

I am getting group messages.

I can go to the internet and check my messages - and can see they were sent. http://aprs. <http://aprs.fi/?c=message&call=WB3LGC> fi/?c=message&call=WB3LGC

Any ideas?

First off, I believe you are inquiring about the new Yaesu mobile? That is the FTM-350...

One thing I have been able to confirm from Yaesu is that the FTM-350 will NOT interface with an aftermarket GPS. You MUST use their proprietary unit.

If that's OK with you, no problem... but I am interested in moving map support, etc, and would not be able to do so with the FTM-350.

Even with separate antennas, the interaction would be problematic considering the practical spacing in any mobile and most conventional home installations. Simultaneous multi-frequency transmission from a single antenna or antennas not widely spaced requires very careful circuitry to reduce the interaction, generally this requires knowing both frequencies. Again, this is possible, but generally not practical for a ham rig.

A simultaneous dual transmit capability would only be useful if there were something useful to be transmitted on both frequencies -- other than simulcasting (which is a questionable use of spectrum at the individual level), the only somewhat useful capability would involve one of the transmit signals being automated with the only common application where this would seem even slightly useful being APRS or some other variant of Packet.

That is exactly why I didn't buy a VX-8; no output for a moving map! I was really hoping to replace my collection of HTs with the VX-8 but not now. The MUCH older D7 did that much. The D7 level of operation should have been Yaesu's entry point.

I have arrived at the point where it makes sense to have an APRS radio and my regular voice radio. No conflicts and easily adapts to any new requirements. My newest requirement in a mobile voice rig is computer control. I want to be able to set frequency, CTCSS, etc from a PC.

Another poster mentioned interfacing with a NUVI. No radio does that either. But there is an adapter called a GTRANS from Argent Data Systems that will connect a NEMA capable radio (D700/D710) to a NUVI350 (Garmin protocol). Again while that is available, the best solution is a TNC/GPS combination that provides the best data. Seeing a waypoint is nice, but seeing more than a dot is better. For instance, using the Garmin protocol a specific waypoint symbol can be used; an antenna for a beacon, a car for a vehicle. A dot is just a point.

Best regards,
Fred, N7FMH

I think when you look closely, you will see that do not transmit on both sides at the same time. They may do cross-band but that is not the same.

When working as net control for our weather group many years ago, we would use a VHF rig to run the net, and a UHF rig to pass the reports. These rigs were hooked to a duplexer, and attached to a Diamond dual band antenna. We would simultaneously TX and RX on both bands.

In later years, my APRS digi, ran a Kantronics 9612, and I had matching Kenwoods (TM-231A & TM-431A) running into a Diamond duplexer, feeding a Diamond X500, and that station would also TX & RX on both rigs simultaneously.

From: Broncus
Topic: 7101 Message: 7109

This describes a repeater set in my area. Each repeater (2M and 70CM) is a GE MSTR II and they both feed one antenna. And they transmit or receive at the same time as needed.

7110. RS-232 GPS, a dying breed. Next steps?

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-21 15:10:35 UTC
From: jwhawk123
Topic: 7110 Message: 7110

Last week I was putting a grant application together for my SAR team, for APRS field trackers.
Our criteria were:
A normal hiking GPS that can be used with or without APRS connectivity.
A normal VHF HT which could be used as backup to the radio each task team is given.
Ability to receive and plot other APRS units on the GPS is very desirable, but not an absolute necessity.

So I looked at Byonics and Argent Data for their TinyTrak and OpenTracker products, to go between the GPS and Radio. Are there any others to consider?

The hiking GPS with RS-232 output is a dying breed, am I correct? I can't find any Garmin current production units with RS-232, although it appears Magellan (the Triton series at least) has native serial data output on the back of the unit, and their data cable comes in either RS-232 or USB flavors. The USB cable has the RS232 to USB converter in it.

Is there any consideration in the works for a next step if/when RS-232 GPS receivers are not available? Bluetooth? USB? I've come across this - http://serialio.com/products/adaptors/BlueSnapXP.php a RS-232 to buetooth dongle, so I guess using a bluetooth GPS receiver would be an option, but that little dongle is kinda pricy, and I would still not have a way to display lat/lon on the APRS TNC unit, plus that little dongle has yet another battery to maintain.

I know Byonics has the option for an LCD display which I presume could at least display lat/lon position, but there's no mounting case option (yet).

My new cell phone is Google Android OS powered, it's got real GPS, Bluetooth, WiFi (and it makes calls too!). I'd imagine the user base is too small at this point, but it would be really cool to have ability to connect my phone to a radio to do APRS.... But in reality, I think that is where the technology trend is headed. That cell phone in your pocket is going to have more and more ability to replace other battery-powered electronics.

Just a few rambling thoughts.

Any ideas?
John

Hi John

The Garmin GPSMap 60 series have both USB and serial ports. I use a 60 CSx with my Kenwood D710 and it plots received stations on the map as waypoints. It should also work fine with the TinyTrak and OpenTrak units that output waypoint data. I think the 60 series is still current since their last firmware update was just last summer.

I picked up a BR-355 (http://tinyurl.com/BR-355-gps) the other day that supposedly does NMEA GPS on the cheap. I have it here, but haven't done the cabling yet to use it. I originally got this from Mike, KA2ZEV. His cabling diagram is at:

http://www.flickr.com/photos/90108848@N00/sets/72157621651452727/

Lynn (D) - KJ4ERJ - Hoping this works with my MT-300!

GPSMAP 276/278 are handhelds, sort-of - and they have NMEA
output/input which can be plugged into a RS232 unit.
Aren't a couple of the smaller ones alsoNMEA capable? Oregon?

I've got a Colorado 300 on loan from Garmin and it works great. You need a special cable to put it into NMEA mode and handle voltage level translation, but it works very well for APRS. It's got an extra NMEA input sentence (included specifically for APRS support) that allows waypoint symbols and comments to be set. As far as I know, the Tracker2 is the only thing that produces that sentence so far.

The Oregon series should have the same capability, but I haven't tried one myself. Saw a bunch of models at CES, but as usual the reps there didn't know anything useful.

As far as I know, only two APRS-related devices will work with the nuvi 350 - the Tracker2, and the GTRANS cable. If you've got something that already has a TNC and you just want NMEA data, the GTRANS will do that. It translates between the Garmin binary PVT data and NMEA format.

7118. APRS message help??

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-23 18:20:22 UTC
From: Stephen M. Shearer
Topic: 7090 Message: 7118

I did some more testing. I connected a PC to the control head to monitor the packets.

I don't see anything coming back for me. IT IS LIKE THE SYSTEM THINKS I AM SOMEWHERE ELSE and is using an igate somewhere else.

I am not getting WINLINK or CQSRVR messages to my station (BUT I can go on the web and see they were sent!)

WINLINK and CQSRVR are getting my messages I send out.

Can anyone help? IT HAS WORKED before? What am I doing wrong (or gone wrong)?

Steve WB3LGC

I first saw the problem when I tried to demo "texting" for a group of scouts doing radio merit badge class. I confirmed the problem when I tried to demo "texting" during a local ECOM drill. NOT a very good demo when things don't work.

Done that.

2010-01-22 16:20:24 EST: <http://aprs.fi/?c=message&limit=&call=WB3LGC> WB3LGC> <http://aprs.fi/?c=message&limit=&call=WLNK-1> WLNK-1: L
2010-01-22 16:20:24 EST: <http://aprs.fi/?c=message&limit=&call=WLNK-1> WLNK-1> <http://aprs.fi/?c=message&limit=&call=WB3LGC> WB3LGC: 1) 01/22 10:28 D710 394 bytes

If I send to winlink to get my messages [L] - I never see the "1) 01/22 10:28 D710 394 bytes" message

I AM sending the message to winlink OK, as web sees it and the reply to me, I just don't get the reply.

I did a reset and reloaded the settings.I noticed that even though I did a FULL reset, the message number didn't get reset.

And I am sending DUPE messages (as I see no ACK)

(I don't think I should be sending dupe messages) - igate is 2 bounce max.

I may be missing them (small screen) but I don't see any packets coming back
to me either.

Could the local igate be one way?

Is the something I can "ping"?

-- as noted below, I do see "CQ" group messages.

Hi from Vancouver Canada

I check my D710A fairly regularly (cycle through repeaters and APRS). I send
myself messages to test the text mail capability. Have you set the
parameters correctly? A silly question but being IT I usually start with the
basics:

TO: EMAIL

[destination email address here] (space) test xmt test xmt (or what is being
sent)

Then send it it off. You should receive an email from the APRS email
handling facility. If the email isn't set just right, it won't land on the
receving

servers. I've cycled text messages and they've landed within about a minute
of being sent.

But another question to ask is -- has anyone found out if a keyboard is
available? There was for the D700.

7119. Re: [APRS] APRS message help??

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-23 18:43:28 UTC
From: Lynn W. Deffenbaugh (Mr)
Topic: 7090 Message: 7119

APRS messaging from Internet to RF is dependent on a suitably configured local IGate. The following must be true:

1) IGate must have "recently" heard your station
2) IGate must consider that reception to be "local"
3) IGate must be configured for gating messages from -IS to RF
4) IGate must be on-line with a working TNC and transmitter
5) Receiver must be in range of IGate or Digi via IGate's gating path
6) Receiver must be able to decode IGate's transmission

The hard problem about all of the above is that there is little or no easily available diagnostics for some of them and others are configurable optinos. For instance, the definition of "recent", I believe is typically 30 minutes. Local is configurable as to how many "hops" the received packet had (and I've not yet gotten a definition of what a "hop" is relative to WIDEn-N and SSn-N aliases).

However, with all of that said, can you hear and decode normal beacons from the IGate that you believe should have gated your message?

Can you contact the IGate operator and ask if s/he is still gating -IS to RF?

If that IGate's software supports it, try sending an APRS message to it that says "?APRSD". It should respond with a list of stations that it considers "direct". If you're in that list, you should at least be "local". However, there is no standard (or possibly not even A) way to query the list of "local" stations.

If the IGate is javAPRSSrvr, you can browse to it's diagnostics page (typically on port 14501) and see a count of local stations and the gating configuration setting(s). That's IF you know the IP address of the IGate itself.

I monitor the APRS messaging capability in my local area on a near-daily basis so that it is there when I (or anyone else) wants to use it. Just like the local repeater, you can't assume it will work if you haven't keyed up the mic in a while.

Lynn (D) - KJ4ERJ - Palm Bay, FL IGate operator

PS. The "system" doesn't think anything. Each IGate independently decides what to gate and what not to gate. The fact that some other IGate may consider you "recently" "local" won't prevent your nearby IGate from gating back to you.

PPS. How long ago did it "work before"? And was it from/to the same
station in the same geographical area?

PPPS. Messages going TO CQSRVR are easy and almost always work when you
are within digi-range of an IGate. It's getting the message back from
-IS to RF that creates the hurdle.

just a control question to be sure I remember correctly: It seems you
are using a TM-D710. Shouldn't a PC be connected to the radio rather
than to the control head?

I have a Kenwood TM-710A that I have a Nuvi 350 connected to with the GTRANS cable, just was wondering if the Yaesu FT-350 work the same? My wife has trouble operating the Kenwood, but I have three Yaesu's she can operate

As far as I know, only two APRS-related devices will work with the nuvi 350 - the Tracker2, and the GTRANS cable. If you've got something that already has a TNC and you just want NMEA data, the GTRANS will do that. It translates between the Garmin binary PVT data and NMEA format.

I don't know the FT-350, and I think I heard that it doesn't output
waypoints, but it will at least get position data from the GTRANS.

well, perhaps someone will be able to answer with certainty about the
waypoints at some point.

I want to say "Yes" (the TM-710D will), but I have to go back through my archives to find the message.

I Know it was a Nuvi, I just don’t remember the exact model off-hand.

Yes, the TM-D710 can use a Nuvi with a GTRANS cable. I believe the
question was about the FT-350 vs the Nuvi.

7126. Re: [APRS] RS-232 GPS, a dying breed. Next steps?

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-24 00:26:08 UTC
From: Gordon Arnold
Topic: 7110 Message: 7126

For simple NMEA0183 data and UNBELIEVABLE sensitivity I am using the USGlobalSat MR-350P to provide data for my fire department's PC-based automatic vehicle location. It's sensitivity spec is -155dB. They work inside our fire stations and even my almost-a-Faraday-cage shop! http://www.usglobalsat.com/p-58-mr-350p-bulkhead.aspx

It is inherently an RS232 product. The manufacturer provides for powering it using a USB-to-serial adapter (that's how we do it in our fire apparatus) or via a PS2 connector (how a neighboring fire department who took my recommendation does it) but any ham should be able to put 5V on the red wire either through the factory PS2 termination or by cutting that off and using a DB9 into an Opentracker or equivalent product (how I do it in my wife's car).

The problem most hams will have with it is that it is a bulkhead mount. That was a necessity for my fire department installations but may deter the mag- and trunk-lip-mount-using crowd. Of course, it's just another ¾" hole for others among us!

I did in my post you just didn't bother to read it.

Kenwood D7, D700 (I own both and have done simultaneous transmit on both as VHF/UHF) plus the D710 can all transmit simultaneously. They each have two power amplifiers one for VHF and one for UHF. The amplifiers are combined internally by a duplexer and fed out the single antenna jack on the back.

John -
In case you aren't yet aware.... your Google phone has Google maps.
Google maps has a feature called LATITUDE Which plots your position
on the phones and Igoogle internet page of any "friend" to whom you
grant permission. Likewise, it allows their position to be reported
to your phone...

Also, there is an ap you can download called GPSed... If you want...
it plots a map of your "track|" for the public or your private friends
to view....that track can be updated as often as 1 per minute....

of course.... if you dont have an unlimited data plan.... you might
wanna think twice before using either of these...

My new cell phone is Google Android OS powered, it's got real GPS,
Bluetooth, WiFi (and it makes calls too!). I'd imagine the user base
is too small at this point, but it would be really cool to have
ability to connect my phone to a radio to do APRS.... But in reality,
I think that is where the technology trend is headed. That cell phone
in your pocket is going to have more and more ability to replace other
battery-powered electronics.

Just a few rambling thoughts.

Any ideas?

> The hiking GPS with RS-232 output is a dying breed, am I correct? I can't find any Garmin
current production units with RS-232, although it appears Magellan (the Triton series at
least) has native serial data output on the back of the unit, and their data cable comes in
either RS-232 or USB flavors. The USB cable has the RS232 to USB converter in it.
>

>
> Is there any consideration in the works for a next step if/when RS-232 GPS receivers are not available? Bluetooth? USB? I've come across this - http://serialio.com/products/adaptors/BlueSnapXP.php a RS-232 to buetooth dongle, so I guess using a bluetooth GPS receiver would be an option, but that little dongle is kinda pricy, and I would still not have a way to display lat/lon on the APRS TNC unit, plus that little dongle has yet another battery to maintain.
>
> I know Byonics has the option for an LCD display which I presume could at least display lat/lon position, but there's no mounting case option (yet).

7130. Trying to get back into APRS

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-24 18:03:35 UTC
From: Darrell
Topic: 7130 Message: 7130

I used to use my APRS setup frequently, but have not used it in several years. I would like to get the system back up and running, but I am not sure if there is better technology or equipment than what I currently have. I live in the Dallas / FTW Texas area and was unsure if there were any local groups that might be able to help me get this back up and running. Maybe even better than before. I only really use my Ham radio during storms or emergencies, so I would need to brush up on changing bands and freqs etc...

The equipment I currently have:

Kenwood TM-D700 in vehicle (I use an older Garmin GPS for my location signal)
a Magellan Roadmate 6000T as my navigation GPS
A Kenwood TH-7D as my hand held (I would like to set up a portable unit for when I am not in my truck).

Any comments would be appreciated.

Darrell

Darrell,

You're using pretty much the same equipment that I have in current operation. I find they work just fine for many operations. I have a newer GPS for the D700 in both my car, and my SUV. I also use the D7 with the same GPS unit, it's just a matter of moving the GPS to which radio I'm using, and making sure that you have the correct cable. I find the Kenwoods are great radio's to use as everything is built into the radio, except for the GPS. Kenwood has produced the D710 as an upgrade to the D700 and a few friends in my area have them, and think they work fine, I just can't justify the money for them at the moment.

I also have my home station set up with a Kenwood TS2000 running with UI-View32, and that seems to work well. I have a Kantronics KPC3+ that is slotted for use as a replacement home station as soon as I can get the cable working properly between that, and the radio that I have.

I'm well outside of your area, but I'm happy to try to help work out how to operate the D700 efficiently. I use mine for all the Ham Stuff, to include many public service events, I'm also involved in SAR work, and am an active Volunteer Firefighter.

If you're looking for a portable unit with everything all in one you can check out the Yaesu VX-8R http://www.universal-radio.com/catalog/ht/0008.html. you have to get a lot of accesories with it, but it's a neat little rig.

Good luck,

73,

Adam

I think I can update my D700 settings to the newer APRS settings if I can find the manual.
I was using an older Garmin handheld GPS that normally uses 4 AA batteries or I can power it with my data cable from the vehicle. Problem is after awhile the AA batteries tend to leak from the vehicle power I guess. Was trying to locate a GPS unit that I might be able to leave on 24/7 or maybe use with my TH-7D. I am going to have to see if I can locate all my old manuals on how to work the radio etc.
I use my setup mainly for storms / emergency. I do local events as LE / Paramedic / SAR.

Thanks,

This is the GPS unit that I use with my stuff

https://buy.garmin.com/shop/shop.do?pID=309#gpsmap60cx

Takes 2AA batteries, and when it's plugged into DC power from the vehicles it doesn't appear to affect the battery life. Mine is on 24/7, and works well. If you get the cables for it, it can be used with the D7 as well as the 700, just a matter of having the correct cables.

This is what I use with the D7

http://cgi.ebay.com/Kenwood-TH-D7A-to-Garmin-GPS-III-V-12-60C-60CSx-cable_W0QQitemZ170435790681QQcmdZViewItemQQptZLH_DefaultDomain_0?hash=item27aec3c759

and with the D700's

http://cgi.ebay.com/Kenwood-TH-D7A-TM-D700A-D710A-Garmin-APRS-Link-12volt_W0QQitemZ130361176173QQcmdZViewItemQQptZLH_DefaultDomain_0?hash=item1e5a21b06d

I have the manuals for the d700, and the d7 as .pdf files if you'd like them.

if it's the same Cable, then you should be able to simply update your GPS, and you're in buisness. Maybe a few setting changes in the radio's, but that should be about it.

I use the same setup D700 and Garmin 60CS. BUt I have rechargeable batteries in the GPS so I never have seen a leak so far. I do recharge them occasionally. If you want to prevent self discharge, use Eneloop batteries or the newer rechargeable kind that are out there, some Duracells and Rayovacs.

I didn't go there to look, but if they're things like CWnnnn and/or weather stations, they're probably CWOP stations that were previously segregated from teh APRS-IS network but recently added to the aprs.fi maps via a separate feed.

7140. RE: [APRS] APRS message help??

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-25 15:49:07 UTC
From: Stephen M. Shearer
Topic: 7090 Message: 7140

Thanks for the information on IGate - I guess most are logical, but it is nice to see a list.

I have a station within one hop who says he is an IGate in his beacon.. (7 miles away)

The "?APRSD" command did confirm I should be able to receive messages. (as it sent three messages back - just what I needed) It was just what I was looking for - a "ping" command. I am able to see all of the packets by monitoring the COM port on the control head and was seeing my packets bounce around.

I have sent him an email - see if he answers.

I don't see any activity (I to RF) from any of my local stations. Since trackers show up on the internet (along with my outgoing messages) I guess a number of stations port data to the internet but don't port back to RF?

I did finally get an ACK from one of my attempts to contact WLNK-1 - from a station 120 miles away. But no data back.

I think the other issue I have is APRS traffic is heavy (local) and the two bounces to the far off station needs three or four bounces to return.

I think WLNK-1 worked from home, but I know I used it while on the road and it worked.

I am trying to find a good way for my family to keep in touch (without cell phones) as we spread out this coming summer. The family is licensed and CQSRVR and WinLink looked like good options as I play with APRS. I am getting ready for the Boy Scout Jamboree and thought my second son and I could use APRS to keep in contact with my wife and #1 son (it would be nice to have a CQSRVR message that "we" arrived safely). If WinLink won't work locally, I guess my wife could still check email.

73, Steve WB3LGC

Cc: TM-D710A@yahoogroups.com
Subject: Re: [APRS] APRS message help??

APRS messaging from Internet to RF is dependent on a suitably configured local IGate. The following must be true:

1) IGate must have "recently" heard your station
2) IGate must consider that reception to be "local"
3) IGate must be configured for gating messages from -IS to RF
4) IGate must be on-line with a working TNC and transmitter
5) Receiver must be in range of IGate or Digi via IGate's gating path
6) Receiver must be able to decode IGate's transmission

The hard problem about all of the above is that there is little or no easily available diagnostics for some of them and others are configurable optinos. For instance, the definition of "recent", I believe is typically 30 minutes. Local is configurable as to how many "hops" the received packet had (and I've not yet gotten a definition of what a "hop" is relative to WIDEn-N and SSn-N aliases).

However, with all of that said, can you hear and decode normal beacons from the IGate that you believe should have gated your message?

Can you contact the IGate operator and ask if s/he is still gating -IS to RF?

If that IGate's software supports it, try sending an APRS message to it that says "?APRSD". It should respond with a list of stations that it considers "direct". If you're in that list, you should at least be "local". However, there is no standard (or possibly not even A) way to query the list of "local" stations.

If the IGate is javAPRSSrvr, you can browse to it's diagnostics page (typically on port 14501) and see a count of local stations and the gating configuration setting(s). That's IF you know the IP address of the IGate itself.

I monitor the APRS messaging capability in my local area on a near-daily basis so that it is there when I (or anyone else) wants to use it. Just like the local repeater, you can't assume it will work if you haven't keyed up the mic in a while.

Lynn (D) - KJ4ERJ - Palm Bay, FL IGate operator

PS. The "system" doesn't think anything. Each IGate independently decides what to gate and what not to gate. The fact that some other IGate may consider you "recently" "local" won't prevent your nearby IGate from gating back to you.

PPS. How long ago did it "work before"? And was it from/to the same station in the same geographical area?

PPPS. Messages going TO CQSRVR are easy and almost always work when you are within digi-range of an IGate. It's getting the message back from -IS to RF that creates the hurdle.

Getting responses to the ?ARPSD might just mean that IGate-generated
messages come back to you over the RF. I suspect it doesn't mean that
messages are being gated from -IS to RF.

> I don't see any activity (I to RF) from any of my local stations. Since
> trackers show up on the internet (along with my outgoing messages) I guess a
> number of stations port data to the internet but don't port back to RF?
>

This is actually frighteningly common. Receive-only IGates are very
easy to set up. Transmit-capable IGates are a bit harder, but if you're
seeing beacons from an IGate over RF, they've crossed that hurdle
already. -IS to RF message gating IGates is simply a configuration
switch in the IGate software that I'm familiar with, but some IGate
operators shy away from it based on perceived liability for transmitting
non-authenticated, third-party traffic. There may be other reasons as
well, but not that I've heard.

> I did finally get an ACK from one of my attempts to contact WLNK-1 - from a
> station 120 miles away. But no data back.
>

That probably originated from a remote IGate that WAS properly gating
messages from -IS to RF. If that station is at the RF-fringe relative
to you, communications might happen, but would be very spotty.

> I think WLNK-1 worked from home, but I know I used it while on the road and
> it worked.
>

"On the road" implies a different IGate/Digi/RF/-IS environment, so home
vs the road are like apples and oranges, they're both fruit and round,
but that's as far as the comparisons go.

You can send e-mails from APRS and, if you setup EMAIL-2 correctly, can even get short answers back. However, that will also require bi-directional APRS messaging to work. If you're going to known locations, you could always research the local EchoLink or IRLP nodes and how to operate them. But nothing beats APRS messaging for roaming around the country. If we can only get IGates to go bi-direction with APRS message gating!

Lynn (D) - KJ4ERJ - Loving APRS messaging!

John -

Yes, consumer devices have migrated to USB connections from RS-232 ports.

OEM GPS receivers (Motorola/SiRF Oncore, Jupiters, Magellan) RARELY had an RS-232 connection --
rather they had a serial TTL output (or inverted TTL).
Daughter boards were then used TTL Level Converters (to RS-232 or now USB) to enable connection to laptop computers.

Hi everybody,
Does anybody know how to read the aprs data stream from my audio card with agwpe in real time directly with Matlab? I would like to create an application that elaborates the position and path of my RC model through APRS.

Thank you

Daniel

The TinyTrak4 supports the Garmin protocol as well, and maps common
APRS symols to the Garmin equivalents. I'm running it on the Oregon
400t, a very nice little unit.

> RC model through APRS.

Does it have to be Matlab? There are methods already available to
display APRS data in 3D. APRSdos and those applications that can
output KML files for use with Google Earth would be examples.

Step 8 is my attempt at humor.

register the pmapserver7.dll AS ADMIN thru a command prompt like this:

>

> 1: right click desktop select 'new'
desktop, where all your icons are if your not running a program

> 2: make a new shortcut
in a drop down window select "make a new shortcut"

> 3: the command to launch should be "cmd"

after you click make a new shortcut it will ask you how you want to start the program, type in 'cmd' without quotes

> 4: hit enter

> 5: shift right click and select 'run as admin'
what i meant to say here is right click the new icon you just made, and select to run it as admin.

> 6: hit enter

> 7: double click your NEW icon and type regsvr32 pmapserver7.dll

<edit>: if there is an easier way to run cmd prompt as admin, please email me the way. thx

ok, there is a missing step. running regserver implied that you added the path, i negelected to tell you this. Easy solution is to MOVE the dll to the root of your c:\, or, simply add the path to the dll in the reg command via the command terminal. my mistake.

email me directly ke4kke@... if you have further problems, as i spent q week figuring out work arounds to make this work, and it DOES work on a 64 bit windows 7 system

Check out the Tracker2 and T2-135 products from ArgentData.

For that matter, with my Tracker2 and GPS-II+ I can see where APRS
stations are as I drive around in my Jeep. The screen's a bit small
though for that application.

From: Darrell
Topic: 7156 Message: 7156

I have a mobile APRS system that was set up with the help of several friends in the past. What is the best way to setup a Kenwood TH-D7A-G for a portable APRS rig? Is there a small gps unit that can be used? Is there a kit offered? I can follow instructions and set stuff, but not really any good setting a unit up from scratch.

Thanks.

Why did you pull this listing so fast? I am interested in one of these. An earlier suggestion to attach this to a balloon and tether it in a spot to digipeat for special events sounds really great.

All the flexibility is a bonus. I hope you consider making them again.

Thanks!

7158. Help on decoding path string as shown in APRS.fi

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-30 01:32:11 UTC
From: n1plh@snet.net
Topic: 7158 Message: 7158

Can anyone either help me learn how to decode these strings or point me in the right direction?

I would like to understand these strings so I can see how my packets are bouncing around.

My radio has it's path set to Wide 1-1, Wide 2-1

Here is a sample path as shown on aprs.fi:

TQPV5R via WIDE1*,WIDE2-1,qAR,W1SQL-1

Thanks for any guidance. I am trying to learn how to tell if I went through any fill in digipeaters, or which station was the iGate.

>

First, I assume you've got a copy of aprs101.pdf. If not, google it, download it, and do some light reading at bedtime. Be ready to be confused in some areas for a while, but it'll eventually work itself out.

As for reading paths, any * in a path represents the last "station" in the list that processed that packet. "station" might be a real digi or an alias like WIDE1 or WIDE2-1 above. What's supposed to happen to a packet as it bounces around the APRS network is kinda like this:

Original packet might say something like WIDE1-1,WIDE2-1 when transmitted by the source station. The "ToCall" (the thing after the > or before the via in aprs.fi's presentation) actually doesn't matter. In your case TQPV5R is probably a MicE encoding of your position. Otherwise, it's an application identifier documented at http://www.aprs.org/aprs11/tocalls.txt. Anyway, back to the path as it moves around.

WIDE1-1,WIDE2-1 - Asking for a low digi to repeat onces, and a high digi to repeat once. Whenever any digi processes one of the aliases, it subtracts one from the SSID (the number after the dash) and retransmits the packet that way, usually after also inserting it's own call with an * (marked "used") immediately before the modified alias. However, if the -SSID decrements to zero, that alias is marked with the * instead of the digi's call.

WIDE1*,WIDE2-1 - Your packet having been digipeated once by a low-level digi that doesn't insert its own callsign in the path

WIDE1,WX4MLB-3,WIDE2* - A hypothetical second digipeat of your digipeated packet by a high-level (WIDE2) digi called WX4MLB-3. The

entire path has now been "used up" (the final component is marked used with the *) and it will not be digi'd further.

The qAR,W1SQL-1 are tacked on by the IGate software as the packet enters the APRS-IS (Internet Side is how I think of it). The q Construct is described at http://www.aprs-is.net/q.aspx and the station ID following it is the IGate that injected the packet into the -IS.

Anyway, you can learn a lot about local propagation by looking at the raw packets and watching the lines that aprs.fi draws as you over over various beacon points.

Also, I generate daily maps of the APRS utilization in North America. You can view them at:

http://ldeffenb.dnsalias.net.nyud.net/Tracking/Act24/* (Trailing * required)

http://ldeffenb.dnsalias.net.nyud.net/Tracking/Act00/* (Trailing * required)

Act24 is the daily and Act00 is an accumulation of the past 2 weeks traffic. The newer stuff is at the bottom.

Enjoy the learning!

Lynn (D) - KJ4ERJ

Someone e-mailed me and made me an offer in the first ten minutes of the listing. Sorry about that! I am working on a new version that will have a built in GPS, and use the power saving code to turn on the GPS before transmissions. In the MT-AIO, this allows the 8, AA battery pack to last 8 days, versus less than two days by keeping the unit GPS awake all the time. The portable digi is a little more power hungry, since it has a receiver to run too, but a few days on internal batteries with 10 Watt bursts seems like a pretty good operational target to me. I am not sure that it is appropriate to make new product posts here (moderator?) but I will definitely be doing updates on this on my own Micro-Trak Yahoo Users Group.

Don't happen to know a good resource for Icom Radio's do you??

I have an IC 320S that I'm attempting to set up as a Digi Radio with a KPC3+ Just having trouble locating the pins for the Mic connector.

Define Portable.

Mobile set up using the D7 for APRS, or are you looking to set up for Motocycle use, horseback, Hiking, Etc, Etc?

I use my D7 when using APRS for those listed above, and then some more. I use a Garmin GPSMap60Cx for my mobiles (d700's) and with the D7. Any GPS that you can Tie to the D7 will work, it's just a matter of what you're looking to do with it.

I'd need more information on your intended use before making a recomendation.

Microsoft Streets with the USB GPS works perfect with APRS+SA and I am sure UI-View as well. I picked mine up for $49.00 at Costco some months ago. The only connection to the D7 is the serial cable. The GPS is from U-Blox using the Galileo GPS chip works perfect.

Subject: [APRS] Using the TH-D7A-G2.0 for a portable APRS

I have a mobile APRS system that was set up with the help of several friends in the past. What is the best way to setup a Kenwood TH-D7A-G for a portable APRS rig? Is there a small gps unit that can be used? Is there a kit offered? I can follow instructions and set stuff, but not really any good setting a unit up from scratch.

Thanks.

Topic: 7156 Message: 7170

In that case, I'd go with one of the Garmin GPSMap Series https://buy.garmin.com/shop/shop.do?cID=143&fKeys=FILTER_SERIES_60 or https://buy.garmin.com/shop/shop.do?cID=143&fKeys=FILTER_SERIES_60 . you can get good Topo Maps for them, and then you have your APRS feed, and waitpointing, along with your Topo map all in one set up.

When I'm out doing that work I have the D7, a GPSMap60Cx tied together with the cable I believe I liked to you previously, and carry them in this http://www.coaxsher.com/radio_chest_harness_rcp_1_pro.html . It's a good combination, with the exception that getting the D7 in and out is a tight fit, and you have to put the radio in Lock mode to keep the material from pushing face buttons on the D7. It also works well when I'm out motorcycling with a remote headset set up for the helmet.

It may not be the perfect set up, but it works for me.

There are two that I have used successfully; not for UI-View, but for AGWTracker which uses the same type of data-stream if I understand it correctly.

One is available from DeLorme on their website in their downloads section. The other is XPort127 which I believe I got from Sourceforge.

Another useful tool for manipulating port addresses and routing the GPS output to more than one "virtual com port" at a time is N8VBvCOM by Phillip Covington.

Frank,

One trick with the ADS cable is you must have the Garmin in it's mount with the power cable plugged into the back and then plug the ADS cable into the port ON THE GPS. The ADS cable must see the buss power from the charging/power cradle to work.

OK so I have set up my kpc-3 and it appears to be working. However my call does not show up on aprs.fi. When I sent a location from my VX-8 it showed up on aprs.fi as being digipeated from my call sign. So apparently the digi is working. But I can't see my digi on aprs.fi.

Ideas? what do I need to set to make it show up?

Date: 2010-01-31 20:20:57 UTC
From: Adam Mahnke
Topic: 7130 Message: 7182

it can get confusing sometimes, read it through a couple of times. I'm sure if there's something you can't get that someone will be able to help sort it for you.

Subject: [APRS] OK what now?

OK so I have set up my kpc-3 and it appears to be working. However my call does not show up on aprs.fi. When I sent a location from my VX-8 it showed up on aprs.fi as being digipeated from my call sign. So apparently the digi is working. But I can't see my digi on aprs.fi.

Ideas? what do I need to set to make it show up?

7186. Correct Cable?

Yahoo group: APRS (2007 — 2010)
Date: 2010-01-31 21:14:05 UTC
From: Darrell
Topic: 7186 Message: 7186

Does anyone know where I can purchase a cable to connect my Garmin III+ to my Kenwood TH-D7A?
Does anyone make a smaller GPS unit that can be connected to a handheld for a small compact handheld rig? I would think it would only need to be able to supply your current location to the radios TNC or am I way off?
I know that was actually 2 different questions.

Odd... I can't think of anything else, unless it's just not getting to an IGate...

may want to let it run for a few hours and see if it shows up after that.

if not the only suggestion I can make is taking it to a 3-3. but I don't know what your local network looks like either.

Give me the call of the digi again please.

You might want to refer to Chapter 7 of the APRS spec (page 28). Your PHG means 25 watts at 640 feet above average ground with an antenna gain of 3 db (no definition of what the gain is over ;-). The APRS specification may be downloaded from www.tapr.org.

PHG Calculators abound on the web. Try http://www.aprsfl.net/phgr.html

> Is W2 correct for my situation?
>

We don't know your situation (at least, it's not contained in this question), so we can't determine "correctness". W2 would imply that you are a high altitude WIDE2 digi. If you were actually that, you'd probably know it, so I more expect that you're a W1 representing a WIDE1 fill-in digi. Or possibly you shouldn't even BE a digi? Only your local APRS RF environment can know for sure.

> What do I use in the SSn-N parameter?
>

Read Fix #4 on http://www.aprs.org/fix14439.html. There may be other better references, but that's where I learned about it. If anyone has a better reference to what SSn-Ns are in use in various areas, I'd love to see it!

There's an excellant UI-View support Yahoo group called (appropriately enough) "ui-view". Join that group and they'll have answers to all of your questions. From the footer of every message in that group:

- Please see http://www.apritch.myby.co.uk/uiv32.htm for UI-View registration information. Fill in you details and then return to collect your registration as directed by the site.

Thought H was height of the antenna? That's why I listed it as 6 cause its six feet above the ground? Might have to change that as I thought it was 640 for H and it would list it a s whole number?

Hi

Just a additional comments to the very good explanation made by Lynn

Lynn wrote

>> Anyway, you can learn a lot about local propagation by looking at the
>> raw packets and watching the lines that aprs.fi draws as you over over
>> various beacon points.

I very much agree, but on the APRS.FI comment i will like to add, that you only see the first path to the APRS-IS that reach APRS.fi... In areas with a good APRS coverage the one packet will take multiple routes to APRS-IS

So where you truly can learn a lot about how the system work on APRS.FI. Nothing beat data directly of the RF, there you with a add-on program to ui-view like UI-path see the different path the one packet takes.

example would be a case we saw in my area, where unfortunate tracker setup together with little bit weak GPS made a mobile station (actual not moving at all) to TX +80 packet during one hour. one Station in the area being a I-gate, but also running UI-path. did receive that packet +1100 times during that hour. That i-gate properly hear 12-15 digis so by that the same packet, but with different path 12-15 times. nut only one of those shows on APRS.FI for several good reasons, but good to keep in mind.

Michael,

Excellent addition! Thanks for adding that. I guess I need to see what all UI-path does and add that support in my APRSISCE client for Windows Mobile and Win32. I'm just about to release KISS TNC support, so it'll now have access to everything the TNC decodes from the local RF. I'm already showing a *N for multiple receipts of a single packet, but hadn't though about putting it on the map display. At least, I'm assuming that is what UI-path does?

This may be a little off topic, but is it possible to use APRS.FI to locate Wide 1 and Wide 2 digipeaters in my area? I have looked at many paths from assorted position reports, and there seem to be several APRS I-Gates, but no digipeaters nearby.

What technique can I use to find these? Aside from using RF other than my VX-8DR?

The more I look at my area, Norwalk, CT, the more I think we desperately need a good digipeater nearby.

Which shows the disaster that can result if some digis in an area are not running new-N paradigm and/or do not have DWAIT=0. All dupes of a packet heard at the same time by sseveral digis are supposed to then retransmit all at the same time (fratricide) so that we don't get 1100 copies but only 15. One each for each digi in the area.

> Bob, Wb4APR

In Teori yes i agree, but not in real live.. That the I-gate do indeed hear the 15 digi is one thing but all the 15 digi do hear each other, so you will see that the I-gate hear both direct, first and second hop packets. On top of that even with 0 delay there are different digi implementations here like TNC2 with UIdigi, TNC with UIview and other the practical delay in those will be slightly different and for that reason there will be cases where one digi be just that little slower so one of the other are already in TX and then have to wait for a free slot.

We are indeed running new-N paradigm

Finally in terms of how many packet to expect we are properly saying the same. The mobile send let's say 80 packets in one hour. 15 Digi hear each packet. I-gate hear one Packet from each digi + direct = 80*15+80 = 1280 in one houre... when we actually saw around 1100 that come from not all digi are hear 100% and due to packet collision i believe.

7213. Help/Suggestions for OT2m Smart Beaconing

Yahoo group: APRS (2007 — 2010)
Date: 2010-02-09 02:13:19 UTC
From: awaschka@bellsouth.net
Topic: 7158 Message: 7213

Is there any convention or suggested values for setting up smart beaconing? I did not have smart beaconing enabled and left the power on in the car while at work today. It was a significant waste of bandwidth. I took a shot and set it at every 10 minutes while below 10 mph and every 2 minutes above 45. I was thinking of lowering the high speed to about 25 with and significantly raising the low speed interval to like 30 minutes.

Thanks,

Al K5TAN

7214. Re: Help/Suggestions for OT2m Smart Beaconing

Yahoo group: APRS (2007 — 2010)
Date: 2010-02-09 05:20:20 UTC
From: Alan
Topic: 7158 Message: 7214

Al,
The default settings are courteous.

30 minutes TX while slow is courteous, 10 minutes is OK only if hooked to the ignition switch and/or power timer. If someone left their tracker on for 24hours while parked, that would be a tremendous waste of bandwidth;-)

If you want to TX more often than every two or three minutes, reducing path to one hop (WIDE1-1) would be OK.
Attached is a link to the Smart Beacon Wiki, and recommendations from a regional APRS Wiki.
Smart Beacon Wiki <http://info.aprs.net/index.php/SmartBeaconing>
Corner Pegging Wiki <http://info.aprs.net/index.php/CornerPegging>

From NorCal APRS
<http://info.aprs.net/index.php?title=NorCal_APRS_Regional_Info>
Regional Page:

* Smart Beacon : SmartBeaconing☐
<http://www.hamhud.net/hh2/smartbeacon.html> transmits beacons depending on speed and direction. This technique is more channel efficient than simple time based beaconing, as it dynamically reduces the number of packets being sent as the unit velocity decreases. The default <http://info.aprs.net/index.php/SmartBeaconing> settings are courteous. Changing the default settings could be detrimental to the network. If the Bay Area APRS.FI <http://aprs.fi/?lat=37.7164&lng=-121.6846&mt=m&z=9&timerange=10800> map shows someone's tracks as a constant red line, they might have changed smart beacon settings to a rate that adversely affects the RF network.
* Stationary Mobile : Non moving objects should TX similar to fixed stations, once or twice an hour is courteous, and will keep an object on the maps. A stationary mobile who's beacon rate is at once every 10 minutes could be considered a spammer, that's 144 worthless beacons in 24Hrs. Properly setup SmartBeaconing☐ <http://www.hamhud.net/hh2/smartbeacon.html> transmits a packet once every 30 minutes while stationary, which compensates for the sometimes "spastic" beaconing while CornerPegging☐ <http://info.aprs.net/index.php/CornerPegging> . Setting APRS DC power to vehicle's ignition switch, or use of a timed power off relay is advised to limit needless QRM.
I think Smart Beaconing is the way to go:-)

Those messages are automatically generated by APRSISCE/32 to define the
labels, units, and conversions for the APRS telemetry data generated by
the client. They will only be generated once per telemetry version that
the client does. These messages used to be generated by APRSISCE on
Windows Mobile every time the client started but are new to APRSIS32 on
Win32.

I hope your UI-View is running an -SSID different than the -15 that
you've got APRSIS32 configured for? Otherwise strange things can happen.

Topic: 7220 Message: 7220

Looking at paths from my VX-8DR on APRS.FI, I can see that I am hitting a Wide-1 digi, but it doesn't insert it's callsign. Is there a way to use only my radio to send a command that would cause the digi to identify itself?

I know that I can send a message like ?info to a particular callsign of a digi and get a reply, but can something like that be done when the callsign is unknown?

I am on the coast of CT and I am wondering if I am hitting a digi in Long Island.

This is typical for a WIDE1-1 digi because it is made from a generic TNC that usually does not have the New-N hardware. In fact, that is why we invented the WIDE1-1 concept so that these old TNC's could be used at least for a first hop.

> Is there a way to use only my radio to send
> a command that would cause the digi to
> identify itself?

Sure, just look at the map. Display PHG circles so you can see all surrounding stations that have good coverage over your station. Then one at a time, enter the actual call of those stations and find out which ones digipeat. If you find more than one, then look and listen and the one that looks (Sig strengtth) and sounds-like the WIDE1-1* is the one... Look at the closest or highest statios on the map. Displa

>

Don't we all wish we could do that. There's a few RELAY,WIDE (very obsolete) digis in my local area that took me over 6 months to figure out. They've been running for years and only 1 or 2 people are still active in APRS that knew about them. Ask around the other local APRS users. One of them probably knows which Digi you're likely hitting.

> I am on the coast of CT and I am wondering if I am hitting a digi in Long Island.
>

In addition to browsing your area on aprs.fi, you can also check out my daily APRS usage graphs at:

http://ldeffenb.dnsalias.net.nyud.net/Tracking/Act24/*USA-NE*.png

(0) shows all traffic and is rather crowded
(2) shows Digi/IGate traffic, but only for those stations that inserted themselves as a digi
(4) shows Movers, Digis, and IGate, but without callsigns. This is a good density plot

However, In all three cases, the NE USA is very dense with APRS activity, so you probably won't even find your station. But the maps ARE pretty cool to look at (even though I say so myself).

Lynn (D) - KJ4ERJ - APRS Infrastructure Visualization

PS. http://ldeffenb.dnsalias.net.nyud.net/Tracking/Act24/* (trailing * required) will list all available maps

http://ldeffenb.dnsalias.net.nyud.net/Tracking/Act00/* (trailing * required) shows a 2 week accumulation of the same data

PPS. These are served from my home web server via a distributed caching server so please be patient with the speed!

So, I enter the actual call of the station I suspect, but what message do I use to find out if it digipeats?

I am guessing I will want to change my path to something other than the usual Wide 1-1, Wide 2-1. Perhaps no path at all, or just Wide 1-1.

Thank you again for the help.

If you ever go mobile, I'd encourage you to keep the WIDE1-1,WIDE2-1.
That path has served me well most everywhere I've traveled to date. If
you drop it down and forget to change it, you can end up wondering where
the APRS infrastructure went.

Remember, the goal of the RF path isn't just to get your packet to an
IGate but to keep the "immediate vicinity" aware of the current
situation. This includes your station. Now, if you were at WIDE2-2 in
your area, I'd certainly be encouraging a reduction...

Lynn (D) - KJ4ERJ - Just my $0.02 for whatever it's worth

I meant that I would change my path only for the test to determine which Wide 1 digipeater I was working.

You enter that callsign as your path. Every staion except the D7 HT should act as a digipeater if you use its actual call as the path...

I have a mobile APRS system that was set up with the help of several friends in the past. What is the best way to setup a Kenwood TH-D7A-G for a portable APRS rig? Is there a small gps unit that can be used? Is there a kit offered? I can follow instructions and set stuff, but not really any good setting a unit up from scratch.

Thanks.

Darrell,
I used my D7 for several months while driving a semi OTR. I have a power module from Batteries America that replaces the battery pack and plugs into the cigar lighter. A Garmin Foretrex "wristwatch" style GPS with a short 2.5mm straight thru cable between the two. While I used the stock HT antenna inside the fiberglass cab you could use any number of external antennas with SMA connector.

7229. PicoPacket RFI

Yahoo group: APRS (2007 — 2010)
Date: 2010-02-16 05:31:48 UTC
From: awaschka@bellsouth.net
Topic: 7229 Message: 7229

Sorry if this is a partial duplicate. Something happened while I was originally composing this message and the compose screen disappeared.

I'm putting together a portable APRS station with a palmtop, Paccomm Picopacket, and HT. It is all hooked up and functional, but the Pico is putting out horrible RFI. The RFI is coming in through the HT antenna because when I take it off, the noise goes away. When the Pico is initially powered up, it is quiet. It stays quiet while processing and responding to commands from the palmtop. But when I enter a CONNECT command, in between the connect request transmissions, the noise level goes to full scale on the HT S-meter. The noise stays up after the CONNECT times out until I unplug the radio connector. When the radio connector is plugged back in the noise is gone. I have tried a ferrite on each of the Power, Radio, and PC cables one at a time, with little effect, but if I have a ferrite on the radio cable and then cup the cable and ferrite in my hands, the noise is suppressed. Has anyone experienced anything like this, and how was it cured?

Thanks,

Al K5TAN

Thanks Howard,

Are you using the Pico near an HT, or is the antenna some distance away? Are you using the Cat 5 cables that came with it, or did you make up some shielded cables somehow?

As best I can tell, Paccomm is gone - their web site is still up but they don't respond to e-mail (or it comes back undeliverable, can't remember which - tried this last year) and when I tried to call them it was either no answer or disconnected (can't remember which).

APRS-RFID works!
You can locate anyone with a $2 APRS RFID tag in his pocket at any ham radio APRS RFID HotSpot...

This cross posted from the APRSSIG:

> > What was the total [RFID HotSpot] cost?

> RFID TAG $ 2 each or so per person
> RFID READER Module $25 or so per club
> 5v regulator $ 2 or so
> Battery $ 2 or so
> LED, resistor, cap $ 2 or so

Add a TNC and radio and your RFID HotSpot is on the air for any APRS operator to walk through and report his presence at the clubhouse, EOC, or in any room at Dayton.

I built mine today and it works just fine.

ARRL/TAPR 2009 Digital Conference DVDs Now Available
Posted by: "Gary Pearce KN4AQ" kn4aq@... kn4aq
Date: Sat Feb 20, 2010 8:18 am ((PST))

ARVN has released a new 6-DVD set of videos from the ARRL and TAPR 2009 Digital Communications Conference, held last September near Chicago.

This year's conference didn't have as much D-STAR info as the 2008 DCC did. Tom Azlin N4ZPT has a presentation on using the DD mode and ID1's at the Marine Corps Marathon, and John Ronan EI7IG has been experimenting with what he calls "Delay and Disruption Tolerant Networking in AX.25 and DSTAR Networks."

Other topics presented include: equipment design and construction, Software Designed Radio, AMSAT/ARISSat, packet, advanced APRS, and Digital ATV. It's all interesting, but I found the Digital ATV presentations to be particularly new and intriguing.

The six DVDs are organized around common topics. Each DVD has several presentations, and most presentations run about 45 minutes (good for club meeting programs, if your club leans a bit technical).

You can buy individual DVDs covering the area you're interested in for $15 each (+ $3 shipping), or the whole set for $75 (but still just $3 shipping). The DVDs are produced in NTSC standard definition video.

And a reminder that DVDS of the D-STAR presentations at the 2008 and 2009 Dayton Hamventions are also available. If you find yourself hungry for more D-STAR information, these DVDs should help fill you up (or at least keep you busy for a day).

Free previews, details and ordering at: www.ARVideoNews.com.

7236. Do Wide-1 digi's digipeat packets digipeated by Wide-2 digi's?

Yahoo group: APRS (2007 — 2010)
Date: 2010-02-24 10:56:52 UTC
From: n1plh@snet.net
Topic: 7236 Message: 7236

Wow, that is some subject, huh? If my radio is set to Wide1-1, Wide2-1 and my packet is only picked up by a Wide1 digi directly, which then digipeats and is then picked up and digipeated by a Wide2 digi, do any of the Wide1 digi's that hear the packet from the Wide2 digi digipeat that packet?

I assume that once the Wide 1-1 is used by the original Wide 1 digi, all future Wide 1 digi's will ignore that packet since the Wide 1 is "used up".

If that is the case, and I am in an area that cannot receive a Wide 2 digi, I will only hear stations direct, or ones that make the Wide 1 digi direct.

Is my thinking right?

7237. Re: [APRS] Do Wide-1 digi's digipeat packets digipeated by Wide-2 digi's?

Date: 2010-02-24 11:15:27 UTC
From: Patrick Domack
Topic: 7236 Message: 7237

Wide1-1 should be digipeated by ALL digipeaters, be they wide1-1,
wide2-2, wide3-3, ...

The next available path would then be the wide2-1, and only wide2-2,
wide3-3, ... should digipeat those.

Hi Ron.
Instead of lugging my service monitor to the mountain I use a scope program in a laptop. I use a HT with the output calibrated and marked on the volume control and feed it to the mic input on the laptop. The trick is calibrating the HT volume to the scope program with a good service monitor as a reference. I use a 1 KHz tone at 3 KHz deviation as a reference. Because of the high frequency roll off in the HT tones other than 1 KHz may not be accurate but will get you very close.

Hi ron,

I know that you are trying to set your deviation for the new OT2m that you are installing and trying to set the power levels in its configuration program.

If you have a local 'motorola' shop that services public safety departments in your home area you may have good luck asking them to check your deviation on their service monitor. I have had good luck getting this done for free on a very occasional basis. I am certain that if I was in there on a regular basis looking for the freeby that I might have a problem. It may also have helped that I retired as IT director for a municipality and was in charge of the electronics in the 9-1-1 and police departments. However it won't cost you anything to ask if you could drive ur rig by and have them check the deviation quickly.

Subject: [APRS] DIGI and voice repeater on same 2M antenna?

There was a website before on running a DIGI and 2M voice repeater on the same 2M antenna, http://www.n3px.com/digiduplexing.pdf Unfortunately I didn't save the file and only saved the link which no longer works. We are trying to put up a APRS digi locally on the 2M repeater site and would like more info. If any one has it could you please upload it to the files or send it to the list again.
Thanks
Carl, KB1EJH

I'm not aware of any. But, there is an AP / Free cell phone based
service called GPSed that will tweet a link from your twitter account
to a page on your free account on their service which will show a
track of your position, continuously updated over a map or satellite
image if your location or track...

if that's interesting but clear as mud, just go to their cite http://gpsed.com/

From: Mark Thompson
Topic: 7248 Message: 7248

http://www.arrl.org/news/stories/2010/03/01/11367/?nc=1
TAPR President Emeritus Dr David Toth, VE3GYQ (SK)

TAPR President Emeritus Dr David Toth, VE3GYQ (SK)

David Toth opened the 2008 ARRL/TAPR Digital Communications Convention. Watch the video www.youtube.com/user/KN4AQ#p/u/6/yBrumFbn05o [Video courtesy of ARVN's Gary Pierce, KN4AQ]
Dr David Toth, VE3GYQ -- President Emeritus of Tucson Amateur Packet Radio (TAPR) -- passed away Friday, February 26after a long battle with cancer. He was 55. A resident of Spencerville, Ohio, Toth served as a Director and Executive Vice President of TAPR in the 1980s and was elected President of the organization in September 2005. With his advancing illness, he decided not to stand for re-election last October and was instead named President Emeritus with Steve Bible, N7HPR, taking the reins as TAPR President.
"Dave was a great manager during his tenure at the head of TAPR," said ARRL Contributing Editor and TAPR Secretary Stan Horzepa, WA1LOU. "I give him a lot of credit for the success of TAPR's involvement in the high performance software defined radio (HPSDR) projects. The ham radio world has lost one of its best with VE3GYQ's passing."
An ARRL Life Member, Toth was a medical doctor who, despite his busy schedule, still made time to be an active amateur. In addition to experimenting with digital communications, he was an avid VHF contester. Licensed since the 1970s, Toth -- a native of Windsor, Ontario -- came to the US in 1993 to practice emergency medicine in Ohio. He was a partner of Premier Health Care Services in Dayton and worked at Lima (Ohio) Memorial Health System and St Rita's Medical Center (also in Lima) until the time of his illness.
"Dave was an extreme pleasure to work with," TAPR President Steven Bible, N7HPR, told the ARRL. "Most people saw Dave's dry wit and humor, but underneath, he was also very passionate about TAPR and promoting the technical side of the Amateur Radio."
QST Editor Steve Ford, WB8IMY, remembered Toth fondly: "After years of telephone chats and e-mails, I finally met Dave Toth in the flesh at the 2006 ARRL/TAPR Digital Communications Conference in Tucson. Some say a brilliant intellect and a well-developed sense of humor are mutually exclusive, but Dave defied the stereotype. It was difficult to keep a straight face at the forums while Dave was muttering irreverent comments. He will be greatly missed."
Bob McGwier, N4HY, who worked with Toth on SDR and other digital communications projects, told the ARRL that Toth was important to Amateur Radio "in so many ways. He was an early member of TAPR, a long time supporter of AMSAT and he gave of his time and talents to promote technical endeavors in Amateur Radio. Dave was an important player in the earliest days of packet radio in that he helped promote packet and supported it with on the air hardware, but he also participated in the development of a widely used BBS software suite that helped promote packet radio. As a board member and President of TAPR, he helped TAPR become the principal support for Open HPSDR, a project to promote the development of hardware and software for software defined radio use by Amateur Radio. TAPR kitted the hardware developments and made the widely available to amateurs everywhere. Dave was a great confidante, advisor, and friend. He will be sorely missed by all who knew him."
Toth was a private pilot for more than 30 years and an avid amateur astronomer. Since he was a young boy, Toth enjoyed looking at the night sky and reading about space and the

stars. He had his own observatory that he opened up on clear nights. Toth was the founding member of the London (Ontario) Astronomy Club and served as its president; he was a member of the Royal Astronomical Society of Canada and belonged to the Lima, Dayton and Columbus Astronomy Clubs.
Friends may call from 3-8 PM Monday, March 1 and 1-8 PM Tuesday, March 2 at the Shawnee Chapel of the Chiles-Laman Funeral Home in Lima, Ohio; a parish wake service will begin at 8 PM on Tuesday. Services will begin at 10:30 AM on Wednesday, March 3 at St Charles Catholic Church. Burial of the cremated remains will be at a later date.

7255. Post an object i.e. Repeater, in UI-View, as if it were "BTEXT ;146.76+ etc"

Yahoo group: APRS (2007 — 2010)
Date: 2010-03-05 16:13:53 UTC
From: wb3cvn
Topic: 7255 Message: 7255

I'm trying to set up a more or less remote location digi and I want to have it place a repeater on the map using the standard format that I would have used, if my KPC-3 were a dumb WIDE1-1 digi and simply beaconing the appropriate info. The format is not in question, just the means to make UI-View post the nearby object so that the world will see it.

Do I enter the info into the beacon line in the Station Setup tab, or in the Status Text tab? I've tried both to no avail and when the program's in KISS mode, the beacon feature of the TNC is disabled so I can't fool it that way by just leaving the TNC beacon on.

I tried both but my object (repeater) doesn't show up even on the UI-View computer's own screen. If I go to Comms Setup and take the host mode back to "none", then use the Terminal to allow the TNC to beacon (BE 1 for testing), then the tnc will spit out the info AND the object shows up on the UI-View map.

How do I make this happen when the host mode is in KISS and the digipeat function is active?

Any positive help on this would be really great.

Thanks.

Whether you are running your TNC in KISS mode or not from UI-View
shouldn't make any difference in the way that same UI-View client will
place an object on the (local) UI-View map and send the packet
containing the object info to RF (or the APRS-IS for that matter).
My home station was beaconing some objects and they all appear; I was
running UI-View/TNC in KISS mode (right now, only to APRS-IS, though).

You might want to post your question to the UI-View group.

7258. When your only tool is a hammer.... Linux APRS payload question

Yahoo group: APRS (2007 — 2010)
Date: 2010-03-06 14:59:28 UTC
From: joe_ki7wv
Topic: 7258 Message: 7258

Hello de KI7WV

I am new to APRS. Have a TNC-X (thanks John!) and Linux Debian setup at a cabin with iGate and RF. The RF is KI7WV-2, the iGate is SMRHVN. I use wview to transmit weather observations to cwop (AS801) and post on the web (www.pocomas.net). The weather observations go out via tcpip and at present I am sending an aprs beacon ki7wv-2 on 144.390. The beacon is working (I can findme on findu) and I would like to move on with some custom programming.

I am looking for the easiest tool (hopefully already written) to send a beacon payload to the aprs system via linux. I would like to send telemetry packets on station status when operating on emergency power (battery voltage, time on backup, temperature etc). So, I would do something (probably perl) to pull the data together and format telemetry, telemetry description, and weather packets to go out via rf when power is down. Assuming I can rtfm and properly format the payload for each of these...

what is the simplest tool to get a packet out the RF port?

I have been playing with the "beacon" command but cannot seem to configure it to have it read by the aprs digi that I am adjacent to.

Another (simpleminded) approach would be to generate a new aprsd.conf file with a tnc beacon text that is specific to the packet that is to be transmitted, then start and stop aprsd.

Finally (the approach I am trying to avoid) is through generating another command line util and seeing if I can get it added to ax25-tools that does what I seem to want beacon to do- send out a payload of my spec, but with automatically increasing time intervals between transmissions, and stopping when the next payload is given.

Sorry for the long post. I have been digging around quite a bit and have not found anything that looks like it will answer this question.

Maybe I am just not using "beacon" correctly for it to send an APRS packet. I have my call sign (KI7WV-2) as "Source Callsign" and "APRS>WIDE2-3" as destination callsign.

Thanks and 73's

Joe KI7WV

Try posting a similar message to:

linux-hams (on vger)
Xastir (www.xastir.org)

It seems to me that you're on the right track with Perl and the
beacon command.

Also note that there are HOWTO's for soundmodem and for Linux AX.25
on the Xastir site. If you're already using beacon to transmit
though you're past those hurdles.

APRS>WIDE2-3 isn't a valid destination format for the beacon command
(unless changes where made very recently).

I use the following to transmit, I also use it from my perl scripts of
wanted to transmit.

/usr/sbin/beacon -c 'K3PDK-1' -d 'BEACON via N3KTX-4, N3KTX-2' ax0
';147.06FDK*111111z3930.05N/07730.05WrT123 R40+ ARES M730p Net Th830p'

I am spec the digi's I want to use in that example, but if you wanted
it generic (and why are you using a WIDE2-3? shouldn't that be WIDE3-3
or WIDE2-2, the last number shouldn't be higher the first number, it
can be lower though).

beacon -c 'K3PDK-1' -d 'APRS via WIDE2-2' ax0
';127.06FDK*111111z3930.05N/07730.05Wr'

power 25W, antenna HAAT 24 m, gain 4 dBi omni,
range 27.1 km
[APU25N via TCPIP*,qAC,AHUBSWE2]

You beacond that lat/lon back on March 5 using UI-View with a direct
APRS-IS connection to AHUBSWE2. Nothing has been recorded on aprs.fi
since then and no raw packets show up (but it only shows the most recent
2 days there anyway). And aprs.fi doesn't offer any other -SSIDs, so
hopefully this is the callsign-SSID for your inquiry.

The only way to change your location on aprs.fi is to actually beacon a
new position. To do that, you need to fire up UI-View and configure the
proper coordinates into it and get it to beacon. For detailed
assistance with UI-View, I'd recommend that you join the UI-View Yahoo
group and ask your question there.

Dennis,

Looking at what Lynn found, I see what you□re saying. I had similar issues when I started with APRS. Just get in to UI-View and □walk□ your coordinates in until you get the icon where it should be. There are several sources of error that can be introduced into the coordinate system causing a problem like you□re seeing, so don□t worry if what you end up putting in doesn□t match whatever reference you□re using to find your QTH.

73,

Mike

power 25W, antenna HAAT 24 m, gain 4 dBi omni,
range 27.1 km
[APU25N via TCPIP*,qAC,AHUBSWE2]

You beacond that lat/lon back on March 5 using UI-View with a direct APRS-IS connection to AHUBSWE2. Nothing has been recorded on aprs.fi since then and no raw packets show up (but it only shows the most recent 2 days there anyway). And aprs.fi doesn't offer any other -SSIDs, so hopefully this is the callsign-SSID for your inquiry.

The only way to change your location on aprs.fi is to actually beacon a new position. To do that, you need to fire up UI-View and configure the proper coordinates into it and get it to beacon. For detailed assistance with UI-View, I'd recommend that you join the UI-View Yahoo group and ask your question there.

Mike and Lynn,

Thanks for helping me out so quickly. The Lat and Long was for my home location. It placed me about 3/4mile to 11/4 mile off my true location. The program I am using is "UI-View32". I was thinking about resetting the long and lat in the setup menu and see if that would make a difference. After reading your suggestions I'll be doing that step next. As you said Mike I may have to make several changes until I get the position correct. Thanks again guys for responding so quickly. One more question for you...I am somewhat new in the APRS/Packet area and most of the information I've gathered has been research using the various yahoo groups (APRS, UI-view, and other groups) and of course "Google". Is there another source that you know of which is reliable for new people to learn this subject correctly? Thanks and the best of 73,

Dennis (KA6GDT)

7267. APRS vs GEOTAGGING vs TinyPack n TinyTrak3+

Yahoo group: APRS (2007 — 2010)
Date: 2010-03-10 00:26:51 UTC
From: m3xem
Topic: 7267 Message: 7267

Ok I'm still learning all that APRS can do, with big thanks to Twitter and www.APRS.FI but after looking at the www.Byonics.com website I'm scratching my head a bit more, I can see the potential for many uses, what kit do I use or need?: and what do I want to do?

Simple and lightweight kit for QRP work.

Nokia N95 with GARMIN GPS Software and has Mini USB port.Takes Pics.
Apps: "ZoneTag" GeoTagging takes Pictures & GeoTagged data & WAP Upload to www.Flickr.com a Free App for Nokia with v-cheap Upload rates using WAP, I can type time & date on the picture using EDIT PHOTO in Nokia Picture Viewer and even Resize to 640x480 for easy fast upload.
Second Hand Nokia N95 £80 - £90

Twitter from Mobile Phone with GeoTagging.
I can Twitpic a GeoTagged picture to the twitter network with search tags #HAMR #AMATUERRADIO #GEOTAGGING Also shows a MAP location link, time date and the colour pic.

QRP Portable Radio Ops,Netbook,GPS2 Unit. Help!
I am using a Yaesu FT-817 QRP 5w radio with 2m 70cm and HF Bands
I was thinking of getting the "TinyPack" to send 80 character messages over the PACKET protocal is it the same as PSK31? and is the Netbook escential? I guess it is, its a shame I cant use my Nokia N95s GPS + APRS Software with my netbook oh well I like the look of the TinyTrak3+ & GPS2 unit as well for full APRS.FI interaction online I'm guessing? Can I get away with just the GPS2 unit plugged into the Netbook and use the radio pluged into the netbook with Software like WINAPRS?? instead of getting a TinyTrak3+?? would this work or would I need the TinyTrack3+ to track my location along with the GPS2? in order to send it up to the network.

Can I send Messages from my netbook n radio via software to D-Star users with APRS?

For now I know I can use ZoneTag to take pics and add GPS data to it, Altitude, Locator Square, Time date Ulpload to FLICKR.com and Twitter where I have many followers, this is linked to GoogleMaps just like APRS.FI except it dosnt show D-STAR and everything else thats live I grant you. But its the Lightest cheapest system i can come up with for now, I have a very damaged spine and fibomyalgia so lightness of kit is an issue, if I can loose the netbook i would, I can send messages via twitter using SMS, the netbook can run HamRadio Deluxe PSK31 WIN-APRS(although i havnt used it). Would love any tips or advice on this subject. I have emailed Byonics with many questions lets see what turns up. thank all for reading! 73s M3XEM

Glad to help, Dennis. It□s fun to try to □walk□ your house into position especially when you fat-finger a number and suddenly your house is 2000 miles away moving 500 MPH. (Don□t ask how I know!)

As for learning APRS, I learned by doing. Most of my research was done just like you Google and the Yahoo Groups. There is a great UI-View group I had major issues getting started with my I-Gate and those guys very patiently talked me through it all. We never did figure out what my problem was, but they sure helped a lot.

Anything you can find written by Bob Bruninga should be taken as Gospel. He□s □da man□ who invented APRS, so he□s obviously the authority on the subject. I see him posting in Yahoo Groups and his writings are posted all over the Internet. Bob tirelessly reminds us that APRS is not just about position tracking messaging is probably THE most important aspect of APRS and probably the most underused. I can□t wait to get even deeper into it and for my ARES group to come up to speed with it. It□s great to be able to track folks in the field, but even better to be able to message.

73 and good luck,

Mike

>Thanks for helping me out so quickly. The Lat and Long was for my home
>location. It placed me about 3/4mile to 11/4 mile off my true
>location. The program I am using is "UI-View32".

Remember the correct position format (from UI-View help):
||Latitude - input your station latitude. The format is dd.mm.nn<NS>.
||"dd" is two digits for degrees. "mm" is two digits for minutes.
||"nn" is two digits for decimal minutes. NOTE - decimal minutes, not seconds.
||"<NS" is either "N" for North or "S for South. Example - 52.58.23N
||
||Longitude - input your station longitude. The format is ddd.mm.nn<EW>.
||"ddd" is three digits for degrees. "mm" is two digits for minutes.
||"nn" is two digits for decimal minutes. NOTE - decimal minutes, not seconds.
||"<EW>" is either "E" for East or "W" for West. Example - 000.02.77W

If you were using seconds rather than decimal minutes for nn, or
decimal degrees rather than minutes for mm, you will not be placed
where you thought.

You could also use the alternate method given in the same help screen
(F1 from Station setup).

http://info.aprs.net/index.php/Main_Page
http://aprs.org/

APRSSIG mailing list on tapr.org (that's the BIG APRS list).

Regarding your lat/long being incorrect: There are various ways of modeling the earth and therefore the lat/long used with each one varies a bit. For APRS you generally want to use the WGS-84 datum. You may be using NAD27 (north american datum 1927) which a lot of maps still use. In my area (N. of Seattle) the difference in the datums is around 90 or 100 meters. If you use NAD83 or WGS84 you should be good.

Also: The maps you're using for UI-View may not be calibrated correctly, so perhaps your lat/long is correct but your map is off. I can't help you directly with that kind of thing on UI-View 'cuz I'm a Linux guy through and through, but as the other guy said the UI-View mailing list is very active and there's a lot of help to be had there.

Welcome!

Subject: [tapr-announce] Spring PSR: Write For It!

The Spring issue of TAPR's quarterly newsletter, PSR, is in the works. If you would consider writing something for PSR,
the PSR editorial board would seriously consider publishing it. The deadline for the Spring issue is April 15, so you have one month to write something!

The Spring issue appears just before the Dayton Hamvention, so if you want to write something that ties in with the Hamvention, then even better!

Thank-you and 73,

Stan, WA1LOU

Posted by: "Ford, Steve, WB8IMY" sford@... wb8imy
Date: Mon Mar 15, 2010 12:38 pm ((PDT))

Technical papers are solicited for presentation at the 29th Annual ARRL and TAPR Digital Communications Conference to be held September 24-26, 2010 in Portland, Oregon. These papers will also be published in the Conference Proceedings (you do NOT need to attend the conference to have your paper included in the Proceedings). The submission deadline is July 31, 2010. Please send papers to:

Maty Weinberg
ARRL
225 Main St
Newington, CT 06111

or you can make your submission via e-mail to: maty@...

Papers will be published exactly as submitted and authors will retain all rights.

Ron,
I agree it is a great idea to be able to trigger a relay with an APRS message to a controller. one message off one message on. and possibly one message for a momentary tripping of a relay. I have used this type of board before on repeaters. They used DTMF signaling over the air.

Think of the applications here doing this. Reboot a computer on an igate, power cycle a digi, shut down a radio on a digi for problems it may be causing. Other options like a vehicle with a tracker that could give you the ability to disable the vehicle.

Assuming you don't have a ring-a-ding telephone at the remote:

1. Put a light timer on the remote to cycle the power regardless of changes. This way it reboots to normal or reboots to the last settings.

2. Decode an IP Port to trigger a relay. This might be feasible through Ham Radio Deluxe at the remote end, maybe by utilizing the existing Rotator control output to the parallel or serial port to a relay amplifier ...

3. ????

Subject: [APRS] need ideas on remote power switch for digi

i have a Argent Data T2-135 on a Alinco DR-135T. I have remote desktop hooked up to it via IP link so i can easy change setting. my problem is every so ofter the system as to be power cycle in order to change setting. any ideas on being able to remote power cycle the radio via IP link or even via a desktop program?
thanks,
K7CDL

Ron:

Read that you have that connected to batteries after I had sent you the web switch. There are tools out there that can do this as well as modifying the web switch to control contacts. Another option that you could do is do a search on remote control devices and see what you come up with. Many will do much more than you want to do so it may be hard to narrow it down to a specific device that will best suit your needs.

Hi Ron,

Take a look at this then. Controls a relay from the printer
port.

And the original APRS has the READ and OUT command formats that allow you to READ remotely the parallel port on a PC and to send OUTPUT bits to control them.

I think it is in APRS1.2 addendum.

Bob, WB4APR

7282. New Kenwood RC-D710 Interface

Yahoo group: APRS (2007 — 2010)
Date: 2010-03-23 02:52:07 UTC
From: Jason R
Topic: 7282 Message: 7282

All,

We have been working on a new lower cost interface for the Kenwood RC-D710 and standard D710 control head. This interface allows you to easily connect the head to any radio for APRS use.

Basic Details:

- Built-in, filtered voltage regulator to take care of the power.
- Standard pinout 6 pin minidin packet port (use included male to male patch cable for plug and play operation with any radio that has a standard packet port)
- Hard mounted PowerPole DC power connection.
- Tough extruded aluminum housing.
- Small size: About 3" x 2" x 1" (LxWxH)

I have posted some inital photos and more details at:

http://www.rpc-electronics.com/710interface.php

We will have these for sale before Dayton and also plan to have them there, in stock, ready for sale, as well.

Thanks!

I know this question has been asked before but I am going to ask it again.

What Software is everyone running these days for APRS on windows xp?

I used to be able to download winaprs which I have done but after running the program I get a error message that maps cannot be found and then it wants me to send a microsoft error report and close the program down each time.

A long time ago I used Bobs DOS version when this program first came out.

Here is what I want to do when I am in my vehicle with the netbook on my D700. I would to be able to run some type of software for aprs.

Any suggestions would be great.

Thanks

I use my own APRSISCE for Windows Mobile and Win32. It's a free
download after you join the APRSISCE Yahoo Group at:

http://groups.yahoo.com/group/APRSISCE/

There's also the beginnings of a support Wiki at:

http://aprsisce.wikidot.com/

Contrary to the out-of-date welcome page on the Yahoo group, here's some
of the current features with more being added weekly:

APRS-IS Client (handles full feed on Win32)
APRS Messaging - Including EMAIL(-2) support
WHO-IS callsign lookup support
OpenStreetMap.org background maps (pan and zoom)
Preload Maps option for off-line use
Track display for all moving stations
Center on (Track) any single station
GeoNames.org street address lookup
GeoCaching.com LOC/GPX loading/display

KISS TNC support
NMEA GPS support
Parse, store, and display Telemetry data (upcoming release)

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile and Win32

From: Randy Allen
Topic: 7283 Message: 7286

Primarily APRS +SA as I've been using it for almost 10 years and know it pretty well. It is now freeware, you just need to e-mail Brent and register it to your callsign. Be warned, it does have a steep learning curve, and you need to get an old version of Street Atlas USA (Ver 9.0 or earlier) for mapping. In the shack I don't run the mapping that much as I can read the text screens in +SA well enough to get most information I need on a day to day basis.

I'm also playing around with APRS POINT, which has more up to date maps and some good features, but seems more APRS IS than RF centered in the way it handles some things (at least so far as I've found so far) I'm really not happy with the way it handles messages/bulletins/traffic as compared to +SA and DOS versions.

I played a little with UI View, which really seemed Internet Centric for my tastes, and when Roger became an SK and had the source code destroyed I went back to SA. If I'm going to be stuck with dead end software (i.e. no more development), might as well stay with one I know and had paid for back when it was required.

Some days I just feel like dig out the old 486 and fire up APRS DOS. I miss the simplified displays (good enough for situational awareness for a fixed station in most situations), handling of weather station display on the map, dead reckoning, and none of the current Windows versions seem interested in implementing it's DF features

YMMV, just my observations and opinions after playing with multiple versions over the past 13 years or so

Hope this helps

73

Just looked you up on aprs.fi and it looks fine. Raw packets show your beacon of about 4 per hour sense 03/25/2010 at the same location. Now if you are moving there is a problem. Just curious. Do you live in your vehicle? If not why do you leave aprs running if you are not there?

7295. [aprsfi] Slowdown on Friday 26th

Yahoo group: APRS (2007 — 2010)
Date: 2010-03-27 18:34:27 UTC
From: Phillip
Topic: 7295 Message: 7295

-------Original Message-------

From: Hessu
Date: 27/03/2010 8:09:33 p.m.
To: aprs.fi
Subject: [aprsfi] Slowdown on Friday 26th

Yesterday the aprs.fi APRS feed was slow for about an hour, between 15:00:55 and 16:11:03 UTC. One of the WXQA servers the service connects to was down, and the connection attempts timed out. The timeout was too long, and the connection retry timer was too short, and the connect() attempt is a blocking call, resulting in slow processing of packets. I knew about the potential problem, but hadn't bothered to fix it until now.

In the evening I implemented a 2-second connect timeout and an exponential backoff for the retry timer. First reconnect attempts will happen within seconds, but they will slow down to about 2 minutes between retries. Using a non-blocking connect() would have been the correct fix, but this was a bit quicker. The problem should not appear again in this form.

It seems like no APRS data was lost or missed, it was just collected in a buffer, and processed once the connect attempts started working again. The following graph gives some idea of the relative processing rate changes. At peak about 10 megabytes of data was in the buffer.

7296. Need help: GPS16 with TM-D700a

Yahoo group: APRS (2007 — 2010)
Date: 2010-03-28 00:45:17 UTC
From: w5jmc
Topic: 7296 Message: 7296

Hi All,

I am brand-new to APRS and must admit that I feel very much like an "amateur." And, I need some help. I have a Kenwood TM-D700a in my Jeep, and recently acquired a Garmin GPS16 at a hamfest that I've mounted and connected to the radio. The GPS16 comes with an RJ45 output, but the ham who sold me the GPS had built a little interface box that converted the RJ45 to the 1/8" connector required by the TM-D700. The box adds independent power via a pair of Anderson Powerpole connectors, which I have running to my West Mountain power block.

So, my problem is that I cannot get the GPS to send data to the radio, or vice versa. At least I think that is my problem. I have the TM-D70 configured correctly, I think, though I may not. However, I understand that the "GPS" is supposed to blink when receiving data from the GPS, and mine doesn't do that. It has never displayed the lat/long on the radio...so, somewhere, I have a mis-communication, but I am at a loss as to how to even troubleshoot it. I downloaded the "SNSRCFG_320" program from Garmin that allows you to view and upload the settings to the GPS16. I was able to connect to the GPS when plugged directly into my laptop...but I don't know what the settings should be. Does anyone have this setup? If so, I'd welcome any help I can get.

Thanks!

John, w5jmc

Make sure it is set to NMEA mode in SNSRCFG_320, and look at the NMEA sentence selection. Make sure $GPGGA and $GPRMC are turned on. Then look at view NMEA to confirm it is outputting them. Set your baud rate to match your D700's baud rate.

At the Maryland hamfest today, I saw two separate Garmin STREET PILOT III GPS units being sold. The first one the guy was asking $80 and an hour later out in the other end of the tail gating area I saw a guy selling one for $30!

I couldnt resist! I got that one for $25. (it used to be $800 new)...
Actually I never even look for GPS units at hamfests. (I have acumulated so many after 17 years of APRS).. But these two just happened to catch my eye... Maybe its because they are so big..

Maybe Ill keep my eyes open the next one.

John,

There are a couple of things that come to mind.
1) Since you were in the GPS16 config program and talking to the GPS16, that says that both the TX and RX are connected which is a good thing. The D700 will not work with the GPS if only the RX (D700 end) is connected.

2)The next thing is the baud rate. Set the GPS16 to 9600 and set the D700 to NMEA96 in menu item 3-2.

Here are the common menu item settings for a D700, at least to start with that we use for tactical:

1. 1-6-3 TNC -> TIME Verify current time
2. 1-6-4 TNC -> DATE Verify current date
3. 1-6-5 TNC -> TIME ZONE Verify current time zone +7 for PDT
4. 3-1 APRS -> MY CALLSIGN Set to Cycle Oregon tactical call.
5. 3-2 APRS -> GPS UNIT Set to NMEA or NMEA96 Depending on GPS receiver settings.
6. 3-3 APRS -> WAYPOINT Set to 9 characters.
7. 3-4 APRS -> MY POSITION Used for fixed position. This menu item will be disabled when NMEA
or NMEA96 is set in menu 3-2.
8. 3-5 APRS -> POSITION AMBIGUITY Verify OFF.
9. 3-6 APRS -> POSITION COMMENT Can be programmed for selected comments.
10. 3-7 APRS -> POSITION LIMIT May want to set this to 100 miles to further limit `NOISE'.
11. 3-8 APRS -> STATION ICON Set to the assigned symbol.
12. 3-9 APRS -> STATUS TEXT Put real call sign in this location.
13. 3-A APRS -> STATUS TX RATE For a beacon rate of 2 minutes we will send our call once every four
times. If we get too much grief for not having a call sign we will change this to 1/1 instead of 1/4.
14. 3-B APRS -> PACKET PATH Set to WIDE2-2
15. 3-C APRS -> PACKET TX Set to AUTO.
16. 3-D APRS -> TX INTERVAL Set to 2 minutes.
17. 3-E APRS -> GROUP CODE Verify the code is APK101.
18. 3-F APRS -> BEEP Set to either OFF or MINE to BEEP on an incoming message.
19. 3-G APRS -> UNIT FOR DISTANCE Verify set to MILE.
20. 3-H APRS -> UNIT FOR TEMP Set to value of choice °F or °C.
21. 3-I APRS -> DATA BAND Verify BAND A.
22. 3-J APRS -> PACKET TRANSFER Set to 1200 BPS.
23. 3-K APRS -> DIGIPEATER Verify OFF.
24. 3-L APRS -> DIGIPEATING PATH Ignore.
25. 3-M APRS -> AUTO ANSWER Verify OFF.

For additonal information, go to the Kenwood web site and download the TM-D700A_specialized.pdf file which is specifically for APRS.

Subject: [IllinoisPacketRadio] Updating Kantronics KPC-3 TNCs

The currently produced Kantronics KPC-3+ is a very common TNC in Packet, APRS, and Winlink applications. You often see the older KPC-3 at hamfests and sell/swap web sites. I have seen them as low as $25. Some of these early KPC-3 TNCs (prior to V8.2 firmware) do not support newer APRS protocols, digipeating, etc. and Kantronics no longer supports this perfectly good hardware.

I ran across a web site the other day which describes a process for updating them:

http://freemansgarage.com/blog/?p=153

His choice of EPROM is not the most economical. I have an alternate suggestion here:

http://www.n9puz.com/kpc3_update.html

Sorry about menu item 3-1. I though I had sanitized the information to be generic, but missed that one. It should read YOUR CALLSIGN rather than the Assigned Cycle Oregon Tactical Call.

I have a document with settings for various TNC's and radios which people have and are used on Cycle Oregon. I just copied the D700 section.

7305. RE: [APRS] Fwd: Updating Kantronics KPC-3 TNCs

Yahoo group: APRS (2007 — 2010)
Date: 2010-03-28 20:03:01 UTC
From: Christopher K. Greenhalgh
Topic: 7303 Message: 7305

Technically, burning Kantronics firmware is a copyright violation, however, it is a wide spread practice.

The KPC-3 uses the 28 pin 27c512 EPROM to hold its programming, and I have *many* of these laying around with latest rev 8.2 burnt in.

The KPC-3+ are of different architecture...they use the 32 pin 27c101 series EPROM, and I have *many* of those with the latest rev 9.1.

I also have both flavor EPROMS with UI-DIGI rev 1.9 beta 3 burnt in, which is open source code, and some of our local users swear by it...designed specifically for digi-ing.

If anybody is interested in getting anything I have, email me at chris(at sign)n8wct.com.

73,

-Chris

Actually the D700 will work with only the receive wire connected. The radio does not transmit any control messages to the GPS and only ever sends waypoint data to the GPS when waypoint upload option is turned on. I have two D700 wired with only the receive wire and both operate just fine.

A GPS 16 out of the box works perfectly. now If you have connected it to a computer and tinkered with the settings. Well, then the mode along with other things may be screwed up and you will have to use the instructions from Garmin to fix it.
I love that lil guy for a simple tracker. I used it in a D700 before I started using it on a stand alone tracker.

> I am brand-new to APRS and must admit that I feel very much like an "amateur." And, I need some help. I have a Kenwood TM-D700a in my Jeep, and recently acquired a Garmin GPS16 at a hamfest that I've mounted and connected to the radio. The GPS16 comes with an RJ45 output, but the ham who sold me the GPS had built a little interface box that converted the RJ45 to the 1/8" connector required by the TM-D700. The box adds independent power via a pair of Anderson Powerpole connectors, which I have running to my West Mountain power block.
>
> So, my problem is that I cannot get the GPS to send data to the radio, or vice versa. At least I think that is my problem. I have the TM-D70 configured correctly, I think, though I may not. However, I understand that the "GPS" is supposed to blink when receiving data from the GPS, and mine doesn't do that. It has never displayed the lat/long on the radio...so, somewhere, I have a mis-communication, but I am at a loss as to how to even troubleshoot it. I downloaded the "SNSRCFG_320" program from Garmin that allows you to view and upload the settings to the GPS16. I was able to connect to the GPS when plugged directly into my laptop...but I don't know what the settings should be. Does anyone have this setup? If so, I'd welcome any help I can get.

Topic: 7309 Message: 7309

Anyone selling a complete setup for APRS for mobile? Still have my Tinytrak n GPS but my 2M mobile dedicated for APRS dead. So would like to get a all in one for the mobile. Run a station at home in the shack but like having the feature in the car too. Just a Tx don't need to watch traffic just shot my info out so nothing that is going to kill my bank account!! Please let me know.

Hi Jeff,

If you use a TM-D710, and some other for a base station, you will not need a GPS, because you can enter you Lat and Long manually. I own two TM-D710s and two AvMap G5s, but I don't use the G5 in our Base Station (we live in a Motorcoach) unless we are traveling. Saves the G5 for when I need it.

I don't have a good answer to your question, but if all else fails,
contact your ARRL Section Manager and ask him to contact your
Section OOC, the Official Observer Coordinator, and get them to
investigate. Just because it's automated doesn't mean that he's
immune to Good Operating Practices. :-)

The key here being "if all else fails." I would always save that sort of thing as a very last resort. Be civil, maybe point out a 'top senders in xxx area' list so he can see that he's doing something wrong (and maybe remind him that as an IGate he can beacon every minute on the 'net, and every 10-15 on the air would be fine.)

Sure, some people just aren't going to listen. But things like OO positions tend to attract petty tyrants who often lack a certain amount of diplomacy and tact, and official (or officious) intervention right off can really bring out the worst in people and give them a bad impression of the hobby.

Yeah, there's a reason I don't volunteer anymore. Maybe I'll try that again when I'm retired and feel like I need more drama and politics in my life.

The key here being "if all else fails." I would always save that sort of thing as a very last resort. Be civil, maybe point out a 'top senders in xxx area' list so he can see that he's doing something wrong (and maybe remind him that as an IGate he can beacon every minute on the 'net, and every 10-15 on the air would be fine.)

let me make this entire issue clear. I don't have anything against this person directly. I know what setting he needs to changes and how to change it if he would only change it and try to take the help then it would make everyone happy. from what I'm see is its his cornering settings, he just needs to change his SBTTIME settings as it shows in some setup programs or some people call it the turn time. I just wanted to make this clear that I have nothing directly against the person its just been over a year since 5 people have talked to him and if is wiling to listen to people I will hope network back up. I just wanted to point this out just in case it got back to him.

I'm not sure I understand your question about "allowing it into the KISS mode", and you didn't say what setup you have, but to block a user in UI-View,go to "Setup" then "Exclude/Include list".

If you're running a Kantronics TNC, you can block them with the "LL" (Lid List) command.

However, this would have to be done at every digi the offending station can hit, and while that would clean up the RF side, you would have to block him at any I-gate to keep out of the online sites.

Once he realizes his transmissions are worthless, Ill bet he'll give a listening ear then. :)

While TNCs are APRS "friendly", they require more attention than the graphical setup interface you get with most trackers.

You need to connect the TNC to a computer via serial port, and use a terminal program to set them up.

As a minimum, you need to set your callsign, btext (lat & lon in APRS format), and beacon rate.

Here's a good link for KPC-3 TNCs; http://www.aprs.org/kpc3/kpc3+WIDEn.txt and http://www.aprs.org/kpc3/kpc3+82WIDEn.txt

While those instruction are for a digi, check out the portions for btext...that should help understand better.

That's a tough one Ron; We have a similar problem user that transmits every 60 seconds with paths that range from 4 hops to 12 hops. Check out some of his settings:
call1 WIDE2-2,WIDE3-3,NV7-7
call2 WIDE5-2,NV4-4
call3 WIDE5-3,WIDE5-3,NV4-4
call4 WIDE1-1,WIDE3-3

This guy comes into California occasionally, a friend of mine contacted him, emailed back and forth asking if he would tone down his path. He ended the dialog with:

"Bottom line: my path remains the same. If you find this annoying, turn off your aprs or learn to be courtious and quit bitching over nothing and ignore it".

So we will try to ignore him when he comes around, I won't black list him, he would probably just increase his path/timing even more, thinking "that's the fix".

Back in the 90's there were packet wars, where ego's and attitudes made a mess of packet. Folks started blocking users, and it festered to the point where many took their marbles and went home.

We should reserve blocking a user as a very last resort. I've had good luck contacting uninformed users via email. Several got their hackles up, and became defensive. But after several messages, kind persistence, backed up with web links, and admission of similar mistakes on my part, most tamed their settings, and our emails ended on a friendly note. Every once in a while you just run into an alpha hotel.

Good luck,
Alan;-)

Hi Phillip,
Many of the remote digis in California trap WIDE3-3, and some of our high level Digis even trap WIDE2-2. Most of our digis are heard directly by I-gates. WIDE1-1,WIDE2-1 is more than enough for trackers in California.

I hope for the day when Digi firmware will be able to parse the whole path, truncate, and insert a sysop preset number of allowed remaining hops. WIDE1-1,WIDE3-3 comes into the digi, and WIDE1*,WIDE3-1 comes out.
Hopefully this would only limit path abusers above the preset limit, and only act on WIDEn-N, not SSn-N or other paths like SAR or TEMP. Folks that want to send a message far, could use SSn-N without being trapped.

As our RF networks get more users (200+ in NorCal), our Digis, will have to get smarter.

I just looked at the track from the last seven days, it seems to have started in Hawaii and moved on a perfect arc to where it's at now. Too slow to be a satellite or aircraft, travelled too far to be a helicopter, it's gotta be a balloon? And how the heck is he getting his signal out?

If it is a balloon, and I suspect it is, it would be at very high
altitude, and should be able to hit many iGates and
digis.....Again, I am assuming.

Confederacion de salas ZONA-EA))
2010-04-04 12:06:16
EA1GUP>APU25N,TCPIP*,qAC,T2SPAIN:;C.ZONA-EA*041606z4812.39N/09851.29WX080/060(((((
Confederacion de salas ZONA-EA))

The originating station is beaconing a position in Spain (http://aprs.fi/?call=EA1GUP).

Yes, it's sending a helicopter signal, but I'd rather think someone was messing around with some object setup in UI-View and left one beaconing periodically with a speed and heading and it's been moving across our maps ever since.

I've found NO indication of any RF activity and the beacons don't include an altitude, so I really rather doubt that this is anything physical.

I just sent EA1GUP an APRS message and received an ack, we'll see if any other information comes back...(http://aprs.fi/?c=message&limit=&call=EA1GUP)

Hello all,

I posted my config file for the KPC3+ to the files section. Can anyone look at it and see what I've missed that would keep it from showing up on the ui viewer or aprs.fi?

Thanks..Don N6NLX.

I agree. I too tracked it back to Hawaii and have noticed two things.
PERFECT digi coverage if it truly was via rf, and not a single deviation
from it's great circle route, meaning not a balloon and not something
that requires fuel.

April fools?

When I test Micro-Trak products in for repair or reprogramming, I often use a GPS Simulator program running on my PC. This places everyone who sends me a unit to briefly show off the coast of Africa, in the middle of the ocean. I sure hope no one is going to go looking for some Ham's from Idaho bicycle beaconing off the coast of dirka-dirkastan......As a Civil Air Patrol Member, I would like to think that they would have let us know if Spain invaded South Dakota.....

The originating station is beaconing a position in Spain
(http://aprs.fi/?call=EA1GUP).

Yes, it's sending a helicopter signal, but I'd rather think someone was
messing around with some object setup in UI-View and left one beaconing
periodically with a speed and heading and it's been moving across our
maps ever since.

I've found NO indication of any RF activity and the beacons don't
include an altitude, so I really rather doubt that this is anything
physical.

I just sent EA1GUP an APRS message and received an ack, we'll see if any
other information comes
back...(http://aprs.fi/?c=message&limit=&call=EA1GUP)

7351. Question

Yahoo group: APRS (2007 — 2010)
Date: 2010-04-04 21:36:04 UTC
From: Darrell
Topic: 1453 Message: 7351

I currently run a Kenwood TM D700-A and a Garmin III plus for APRS.
I admit I can not hold a candle to 99.999% of the APRS users but want to learn as much as I can.
I am going to update my path to Wide 1-1, Wide 2-1 as I see suggested on most forums.
Is there a better GPS system to use with my D700?
Are there any other settings I should adjust for my benefit or to make it a better tool while working storms and emergency events?

Any suggestions would be appreciated.

Thanks
Darrell

Different default baud rate? Gibbersish on a com port is usually that.
Or the KPC-3+ is in KISS mode?

I have the baud rate at 9600, data 8bits no parity, 1 stop bit, I also have no keyboard input,ie: nothing happens when I press keys on the keyboard. I may have to reset my TNC, I hate doing that, took me quite a while to get it working properly. I have had it connected to UI-View, it might be leaving the TNC in a undesirable state when I close it. The terminal screen looks ok in UI-View. Thanks

Before you reset your TNC, let me send you a KISSOFF.EXE program that I wrote for my son, KJ4DXK. He runs a KPC-3+ with his own custom tracker implementation and sometimes leaves his TNC in KISS mode and needs to get it out.

Watch for KISSOFF.ZIP containing KISSOFF.EXE to come via e-mail. It won't be a virus if it comes from me with instructions on how to run it.

Teddy,

Here's the kissoff.exe program I mentioned in the [APRS] mailing list.
I've included the source code, but not the library that it invokes for
talking to the comm port. It amounts to sending 0xC0, 0xFF, 0xC0 to a
serial port which will drop a KPC-3+ out of KISS and back into command
mode. To run the program, open a command prompt and enter:

kissoff COMn:9600,n,8,1

where n is your actual COM port number. After that, you should be able
to talk to it with a terminal emulator.

You're welcome. I'm glad you've got it all going again. I also run
Alinco DR-135s, but with T2-135 TNC boards internalized. They work
really well with the (discontinued) Nuvi 350 for GPS and APRS messaging
interface.

From: n1lul2
Topic: 7362 Message: 7362

Anybody using the Tiny Trak 4 with APRSPoint? If so, what TNC settings are you using. I am using the Alpha firmware V0.61. Do I need to use a AGW Packet engine to make it work?

Thanks

Ray- N1LUL

Try just the command "unproto on"

I used to notice that when I switched from APRS to pactor/packet and winlink that I got gibberish. The uview software changes the proto to the Aprs proto

From: kc0rey
Topic: 7364 Message: 7364

I've posted this on the other APRS Yahoo Groups.....

A couple of months back, I switched from Windows XP Pro to WIndows7. Same computer, just upgraded the software. I am running UIView.

My rig is a Kenwood TM-D700A and as an experimented I connected to an old TNC Plus Multi-Mode VER. 7.0 and a Yaesu FT-2500M.

Previous to my software upgrade I was running in KISS Mode and was able to connect to the APRS server and operate as a Digi.

I am unable to connect in KISS Mode on either setup, and the only setup I can get to work is Host MODE: NONE. I can not get either of these setups to Digi. The TNC does not support DIGI Mode but I am certain the software allowed me to in the past. The Kenwood does allow DIGI but will not, even when I edit the commands to DIGI.

I don't really need to connect to the APRS Server but I do need to DIGI.

Does anybody have any ideas?

Thanks in Advance,
Steve KA9MOT-1

7367. Tracking APRS

Yahoo group: APRS (2007 — 2010)
Date: 2010-04-07 07:08:40 UTC
From: zl1gbb
Topic: 7367 Message: 7367

This is actually a Ui-view question but I don't want to have to join the Ui-view group just for one question. Pretty sure some one here will know the answer.

Is there a better bit of software around for tracking than Ui-view height/track? I would like to be able to record tracks but don't seem to be able to find anything.
Ui-height/track is pretty old. Text talks about Win95 and 3.1. Must be something later?

It doesn't record tracks to disk yet, but will display tracks with attached altitudes at each point. I'm working on a UI-View replacement program called APRSISCE for Windows Mobile and Win32. You can download a free copy by joining the APRSISCE Yahoo Group at http://groups.yahoo.com/group/APRSISCE/ You can also read about the program's features at the (evolving) Wiki: http://aprsisce.wikidot.com/

Saving station tracks as a GPX file is on the ToDo list which is attached to the Release Notes in the Yahoo group's file section. When do you actually need the feature? I can maybe bump up the priority of saving the tracks to meet your schedule.

From: Darrell
Topic: 7369 Message: 7369

Question

I currently run a Kenwood TM D700-A and a Garmin III plus for APRS.
I admit I can not hold a candle to 99.999% of the APRS users but want to learn as much as I can.
I am going to update my path to Wide 1-1, Wide 2-1 as I see suggested on most forums.
Is there a better GPS system to use with my D700?
Are there any other settings I should adjust for my benefit or to make it a better tool while working storms and emergency events?

What does !SN! do when added to my status text? I can not see any change. It is supposed to be needed for Storm Track APRS.

Any suggestions would be appreciated.

Thanks
Darrell

other then over kill for aprs in my opion. using this type of setup you cant talk and have data at same time, you have to have one or the home. right now I use a HT but I'm going to be changing over to my FT-2700RH as soon as I can get a different mobile. what I'm trying to get to is save the costly radio for just voice. Kenwood V71A,V7A,and the 733A is the only ones that doesn't have a tnc built in that will do data and voice at the same time. just my own opion.

OK;

>Is there a better GPS system to use with my D700?
Any GPS with a _serial_ communication for the NMEA data strings (and not with USB) will work. I have been using the D700 with a GPSMAP276C in our car. I have also been using smaller - hand held - Garmin units, but the display is getting to small to easily see other stations symbols, like other APRS fitted cars. The 276 is a good combo for car navigation _and_ APRS in one unit.

> Is there a better GPS system to use with my D700?

Darrell any serial GPS will work with a D700. (That implies that NMEA
is available.)

There is only one GPS that is better and that is the AvMap 5. It was
designed to work with a D700 and has been improved to work sightly
better with a D710.

I did a PX on my D700 to a D710, when I bought my AvMap.

My first GPSr, a Garmin GPS-75 worked very well with my D700, much
like your Garmin III.

I'd stick with the current GPS for now. I ran a GPSIII+ and D700 for a long time until I bought a new GPS (Garmin Nuvi 350) . The only thing wrong with it was I had a hard time seeing the display the last few years. I feel in many ways it was better unit than some the current units. It may not act as a DVD/mp 3 player or any other things the current ones do but it did what it did very well. As far as the the !SN! I can't help you maybe someone local to you knows what that does.

I like my Garmin Nuvi 350 but there are 2 problems that I see with it from an APRS point of view -
1) It is a USB slave device. It requires a USB master device to communicate with due to USB protocol.
2) I have not been able to get real time updates out of the USB port into my PC. This could be my own ignorance as I tend to treat this GPS as an appliance more than anything else.

7383. Smartbeaconing while walking?

Yahoo group: APRS (2007 — 2010)
Date: 2010-04-11 18:29:33 UTC
From: Stephen M. Shearer
Topic: 7367 Message: 7383

SmartBeaconingT works great while driving - does anyone have settings to use while walking? I am sure - with trial and error - that I can find settings that will work. I want to be able to have beacons every two? minutes while walking and maybe every ten minutes while stopped? I tried a beacon every 3 minutes and it doesn't track very well (corner pegging will help).
73, Steve WB3LGC

What might be nice would be another beaconing method (or add to SmartBeaconingT) to beacon every n00 feet - like my handheld GPS will leave "breadcrumbs" every 10 feet (I realize 10 feet would be unrealistic for APRS). This would be great for "less then - slow speed" if walking but not stopped. If stopped, beacon every 30 min's - if you move n00 feet, beacon (aka you were not stopped...)

Date: 2010-04-12 11:39:26 UTC
From: Adam Mahnke
Topic: 7367 Message: 7385

I was actually experimenting with this yesterday. I sent out my tracker set up with a bicyclist for a running event as he was out in front of the pack. I however had the settings all wrong, as it was set up for a bike race, and to be used in a car.

I tweeked my settings, a little, and came up with a slow speed of 1mph, and a fast speed of 5mph. The slow speed was set to 120 Seconds, and the fast speed at 90. Just for experimentation. I also set the corning so the degree change was 20 degree's it would beacon. I then sent out one of the harmonics (read as hyper active child with too much energy that needed to be burned off) with the tracker and those settings, and it seemed to work rather reasonably.

The last set of times is the walking child. The farther away from the campus lines are on the bike, with the wrong settings.

http://aprs.fi/?call=KC2ANT-12&dt=1270944000&mt=m&z=17&timerange=3600

I'm not sure the Feet thing would work well. I've been sitting in parking lots before watching the GPS, and seen it give a speed and direction, even though I wasn't actually moving. But it's an interesting concept.

My tracker is a tinytrak3 set up. http://www.byonics.com/microtrak/mtaio.php

Good luck,

Adam

cEc2xrA3Ztc2cEc3RpbWUDMTI3MTA2MjEwMw--> Smartbeaconing while walking?

Posted by: "Stephen M. Shearer" <mailto:wb3lgc@...?Subject=
Re%3ASmartbeaconing%20while%20walking%3F> wb3lgc@...
<http://profiles.yahoo.com/wb3lgc> wb3lgc

Sun Apr 11, 2010 11:29 am (PDT)

SmartBeaconingT works great while driving - does anyone have settings to use while walking? I am sure - with trial and error - that I can find settings that will work. I want to be able to have beacons every two? minutes while walking and maybe every ten minutes while stopped? I tried a beacon every 3 minutes and it doesn't track very well (corner pegging will help).
73, Steve WB3LGC

What might be nice would be another beaconing method (or add to SmartBeaconingT) to beacon every n00 feet - like my handheld GPS will leave "breadcrumbs" every 10 feet (I realize 10 feet would be unrealistic for APRS). This would be great for "less then - slow speed" if walking but not stopped. If stopped, beacon every 30 min's - if you move n00 feet, beacon (aka you were not stopped...)

I have not found a setting I like. When I am walking, hiking, kayaking or off-road bicycling, I just set it to transmit every 3-5 minutes. I make too many turns which makes the SB beacon all the time.

Best regards,
Fred

The GTRANS cable will do bidirectional translation to and from NMEA for
the nuvi 350. It doesn't use the USB protocol, it uses a 'hidden' fleet
management interface on the same connector.

7398. Trimble Placer 455 config?

Yahoo group: APRS (2007 — 2010)
Date: 2010-04-16 04:01:17 UTC
From: jparks29
Topic: 7398 Message: 7398

Having the damndest time configuring it.... Tried hooking it up straight through and null modem.. in every config I could think of...

Only gibberish at any baud rate setting...

updated the firmware.. same thing...

Using a USB->SER adapter, and I can get NMEA off of one port PERFECTLY (so it's not an adapter problem), but I need in on two, and I can't for the life of me figure out the GPSSK program..

Someone point me in the right direction?

Not sure what you are trying to do. The Placer 455 was a circa 1996 8 channel OEM unit. Since you have the GPSSK program then you may have found the Trimble website and have the placer45X_manual file. This manual says that the communication default is 9600,8,1,N for either the radio port or the MDT port.

Maybe the gibberish you're seeing is the native TAIP (Trimble ASCII Interface Protocol) that is the default state.

It's been six years since I messed with one of Placer units but it seems that they were a very versatile GPS receiver. Here the Illinois State Police had many of them installed in their cruisers back in the 1990's and they worked with a rudimentary vehicle tracking system. Unexplainably, there was a very high level of failure with the units as the connectors kept coming loose or the antennas got crushed, especially near donut shops.

73,
Al, K9SI

Call for Papers--2010 ARRL/TAPR Digital Communications Conference
Posted by: "Ford, Steve, WB8IMY" sford@... wb8imy
Date: Thu Apr 15, 2010 11:12 am ((PDT))

Technical papers are solicited for presentation at the 29th Annual ARRL and TAPR Digital Communications Conference to be held September 24-26, 2010 near Portland, Oregon. These papers will also be published in the Conference Proceedings (you do NOT need to attend the conference to have your paper included in the Proceedings). The submission deadline is July 31, 2010. Please send papers to:

Maty Weinberg
ARRL
225 Main St
Newington, CT 06111

or you can make your submission via e-mail to: maty@...

Papers will be published exactly as submitted and authors will retain all rights.

73 . . . Steve, WB8IMY
ARRL

I'm using .61 code with the a mode set to kiss. AGW Packet engine configured as a PK96 Kiss Simple, and APRSpoint connect to AGWpacket engine. I used the splitter cable to connect a GPS and the PC. With a Garmin GPSmap60c I can also see the waypoints on received packets.

Works great.

Topic: 7362 Message: 7415

I set up my TT4 using a splitter cable:
AMODE KISS
ABAUD 19200
BMODE GPS
BBAUD 4800

set AGW packet engine up
TNC Type PK96
Sub Type KISS Simple

set APRSpoint connect TNC
use AGW packet engine

works no problem

I though I posted this before, but do not see it. Sorry if it shows up twice.

First, I'm assuming that your TT4 is actually decoding other packets and those are visible in your terminal emulator. If this is not the case, you need to tune the TT4 for receiving and decoding first using the RXAMP and MONITOR commands. Target a monitor of about 80 when receiving a good sounding packet.

Second, you don't mention where you're sending the message from that you're not receiving on your TT4, but I'll assume that it is from the Internet and not another local RF APRS station. This requires a properly configured IGate nearby that has "recently" heard a beacon from your TT4 and considers it to be "local" (not too many hops away). Then, the IGate needs to also be configured to gate APRS-IS messages to the local RF with a path that can actually reach your TT4.

I've written an article about the various things that have to work for an APRS messaging to be successful. You can read it at:
http://aprsisce.wikidot.com/aprs-messaging-explained

Oh, and having just noticed your 2E0DMB callsign, I'm guessing that you're in England which, based on what I've read in G4ILO's Blog (link below), is a particularly inhospitable country for unattended operating stations that can carry 3rd party traffic, namely IGates which gate messages from -IS to RF.

So, I suspect your fundamental problem, assuming the TT4 is tuned well for decoding, is the lack of a bi-directional IGate to get the message from -IS to RF. See if there's any local APRS RF user that can assist you with testing direct RF to RF messaging.

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile and Win32

From: Phillip
Topic: 7423 Message: 7423

Hi all,
May I introduce myself.

Phillip ZL2TZE I am an active APRS user and also moderator for several Yahoo groups

my Email is zl2tze@...

I have just become a moderator for this group, Ray KD4BBM has been away and this has taken a day or two to sort out..

Hopefully between the 2 of us we can improve this group it is one of the larger APRS groups and we both would like to see it grow.

1 Thing !!! if you have a problem or see spam PLEASE email Ray and myself and NOT the list we will attend to it as soon as possible
those members re posting spam messages will become moderated .

email aprs-owner@yahoogroups.com

As I live in a different time zone I will be around when Ray is not so hopefully we will get on top of it, there will be times when both of us may be away or on business and for this very reason all new members will be moderated until we are happy with the postings.

Enjoy bring on new ideas / suggestion etc , but please remember both Ray and myself have a life as well..

73 Phillip
ZL2TZE

7430. How do I create APRS Object for local repeater frequency????

Yahoo group: APRS (2007 — 2010)
Date: 2010-04-19 05:05:47 UTC
From: k4oc
Topic: 7430 Message: 7430

I would like to xmit via RF our local UHF repeater as an object.

How do I go about transmitting the object from my APRS Station via RF. I want local stations traveling through to see that object on their radio so that they are aware of our repeater and its coverage and tone requirement.

I am versed in sending messages on APRS and see other people transmitting objects over RF but I am not sure what method is used to send the object. I know how to send a message but have no idea what I use to send the object out. I have APRS at home and mobile and both are RF with the one at home having internet access.

I am not interested in creating an object on my computer and having it show up on other pc running UIVIEW. I am interested in making sure mobiles receive this via RF on their APRS device in the vehicle. If a by product of this is that it will also get gated to the internet that is fine.

Thanks,

Sam Cederas

Hi Sam,
The best way to do this is via the local area digi and not
from your home PC . This then makes 100 % sure that it is only local area
coverage

Most digi's have 3 or 4 beacon slots that can be used and be set to no path

The symbols / Icons can be found here

I maintain 2 local Digi's and they display our primary, and secondary skywarn machines. The key to sharing with the mobiles, is the formatting. APRS.org is a good reference website, I suggest bookmarking it.

Dayton Travel day approaches!

Every local area within a day's drive of Dayton should make sure their APRS local digi is putting out their local freq object for travelers. Please see www.aprs.org/localinfo.html If you don't check your own local area, who will?

Simply turn your APRS mobile radio on, wait 10 minutes, and the local recommended VOICE frequency should show up. If it doesn't, then organize your locals to get it on there.

it all depends where you live. in wyoming where i live a lot of us run wide1-1,wide2-2 but in a busy state like CO you would want to run only a wide1-1,wide2-1. without knowing the area you travel in this is a hard thing to answer. there is some people that run only a wide2-2 the problem with that is i have seen some digi to only TX with wide1-1 so wide1-1,wide2-1 or wide1-1,wide2-2 would be best but like i said, where are you traveling?

Hi Curt,
For a 15000 mile tour I would be setting it to Wide1-1,Wide2-2.
That should cover anything you meet.(Within Reason)
Cheers,

We live in eastern Oregon. Until last week there was not a digi that we could hit locally. I had to run a path of wide1-1,wide2-2 to ever get a signal into a digi here. I put up a fill-in digi last week and now we have coverage here.

We travel south to Arizona almost every winter. When we are on the road we often move in and out of areas that have a better network of digis. However since we traverse the area in either a few days or hours I do not bother with reducing the path count.

If we are going to be in an area with a good digi network then with the Nuvi it is really easy to change the path from the Nuvi. All you have to do is enter the path command from the keyboard and put either wide1-1,wide2-1 or wide1-1,wide2-2 in as the command parameter.

Bottom line is that if I were going to put the roadmiles in as you plan I would use a wide1-1,wide2-2 path.

73 and travel safely

Thanks Kevin:

That is pretty much the consensus between here and the Tracker2 forum. We travel mostly interstates but traverse some remote areas thru the appalachians and similar.

I appreciate the good intentions of all of the individuals who have replied to my initial question.
I still do not think I have conveyed what I am looking for.
I am not looking to send out an APRS Object via a slot from a digi that I may or may not maintain.

The next few sentences here I am going to only be talking about RF. Via RF I am receiving Objects on my TM-D710 screen. When I scroll through the list of received stations I see several objects in the list. My radio is not connected to the internet however it can be.

Anyway I just would like to send out an object for our local repeater that other mobile stations driving around can see. I have seen information about changing the mycall to the name of the object and entering the information about the object in the text. Been there and it does not work on the TM-D710. I even tried entering info like that via MCP-2A ... and it just errors out when I try to enter that info. The only info my TM-D710 will handle is a simple callsign with or without a SSID. I cannot enter say K4OC-R or 442.074...or anything of the like so I am back at square one.

To be sure this is not a top secret manuver.

I would like to hear from those who have done this and are having their objects SHOW UP on RF LINKED APRS Stations. Pretend there is no internet when doing this even though I REALIZE that these signals will be gated to the internet. The source of my object is going to be RF.

Thanks all..... 73 K4OC

If you read my post earlier in this thread, then you know I run the gamut when it comes to APRS set-ups.

While the Kenwood APRS mobiles provide a lot of information to the user, they still lack some important APRS functionality--the ability to send messages is limited by the input method, no ability to send objects, and no ability to see positions on a map. To really access all that APRS can do, you still need some sort of computer.

However, the Kenwood and Yaesu APRS radios are a great way to get started in APRS. A Kenwood TM-D700 was my ticket to APRS. I bought it not for it's APRS features, but because it was the only dual-band mobile that met my needs. After I had it for a while, I started dabbling with the APRS features and, well, I got hooked.

The goal of an APRS DIGIPEATER is to SERVE APRS users in its footprint. This means hearing their packets, serving out others packets, and serving travelers THREE OBJECTS of local highest value to the visitor or traveler.

Last year we MODIFIED the New-N Paradigm so that every DIGIPEATER using a KPC3 type TNC has room for three such objects. This is a good number. It forces a limit on SPAM and EGOS to limit this pushed info to only the most important 3 RF assets for the mobile operator. Throwing too much SPAM out there clutters displays and makes people ignore it as SPAM.

If your local digi is not doing this, then get with the SYSOP and ask him to add these 3 objects. Other DIGI's like UIDIGI ROMS can support two othher objects. Etc...

Now, to answer your questions directly...

> Anyway I just would like to send out an object
> [from my mobile] for our local repeater that
> other mobile stations driving around can see.
> I have seen information about changing the mycall
> to the name of the object and entering the
> information about the object in the text.
> ... it does not work on the TM-D710.

It will work on the D710 and any other radio, but only under the very limited conditions that the name of the object is limited to 6 characters and has only numerals and letters (llike a callsign) IE, TRAFFC, WRECK, etc...

> I cannot enter say K4OC-R or 442.074...
> or anything of the like so I am back at square one.

Yep, best you can do is 442074

But then that is all your radio can do. Another way (not receommended) is to find an old TNC and radio and put the object in the TNC BTEXT and set the beacon to every 10 minutes and the path to DIRECT. NO VIA's!

But this is not recommended for long term objects either because it cannot hear what the local digipeater hears, so it will just add QRM to the channel and block others. That is why there is only one recommended place for local objects, and that is inside the repeater TNC itself. It is the ONLY TNC in the area, that

1) can hear a clear channel and not add any QRM,
2) provide the desired coverage direct.
3) Keep the packet in the same footprint as the digi's service
area
4) be maintained by the local network sysops
5) Amortize TXD delays by appending on the end of other packets.

Thanks for your patience. I have figured it out. I will post it here to save someone else the time and effort I spent. I am all the better for figuring it out on my own but I certainly appreciate all that replied here. A bit of info here...and a little there.

This is what I had to do so I could send out an Object over RF for a local repeater I am part owner of.

1. I plugged the data cable for my Kenwood TM-D710 into the data jack that is on the back of the remote control head INSTEAD of the back of the radio itself.

2. Started UI-VIEW32 --->setup-->comms setup. Handshaking none,Host Mode KISS, clicked "setup" and chose TM-D700a.

3. Action---> object editor. Created the object for the local repeater.

4. Setup-->miscellaneous. Chose "10" for the value of Object interval.

The rest is the regular stuff one does to get UI-VIEW32 working.

Previously I used UIVIEW32 for APRS by connecting to an APRS Server over the internet. Now I am using it for RF ONLY.

I chose 10 minutes for the object interval only because of a message received previous about that. Is 10 minute intervals for the object to be transmitted over rf okay? My purpose for sending it is to make VISITORS aware of our voice repeater.

The object I created is called "442.075+" I mention in the text that it is at 1,200ft and has a pl of 114.8 in Apex, N.C.

I look forward to hearing from you guys.

THANKS AGAIN EVERYBODY.

Again, while I welcome and applaud your objective, you have not mentioned why you need to originate this object from a home station instead of from the digi, inlight of all recommendations to the contrary.

Again, please understand that I do very much encourage and appreciate your effort to get these beacons on the air for travelers, but only if they are done right (from the digi where they have ZERO impact on users and the local network throughput). But on the other hand, If they are done from anywhere but the digi, they are an added load on the network, take up TWO blocking slot times which can collide with other users instead of NONE.

AH, HA! now I see the problem. Looking on FINDU.COM, the nearest digi is 9 miles away and it is obsolete and has not even been updated to the New-N paradigm. In fact, none of the digis in the area are fully New-N compliant, and I cannot seem to find any of them that are putting out these objects(though they cannot be seen remotely unless an Igate is in range). So I could ne in error.

N4JJS-1 is not showing any New-N configurations

KD4PBS-3 is mostly New-N compliant, except that it has an "N" overlay instead of an "S". No evidence of any traveler info objects.

KJ4BX is an xastir station and does not have any PHG so no one can tell anything about it s range.

Your home station does not have any PHG info either so we cannot seee how it fits into the network topology.

Your home location appears to be good for travelers on 64, I40 and 440 but it would be nice to see your PHG circle to see your

range. So keep up the good work. And maybe sometime someone will upgrade the digis to the New N paradigm of 2004.

See www.aprs.org/fix14439.html on how to set up a digi to the New-N paradigm.

And for others to see how to set up the local info beacons, see: www.aprs.org/localinfo.html

Looks like a very actie area. Have fun!

Bob, WB4aPR

I am not sure I am following you on that one. I am sending my object out via rf to the KD4PBS-3 digi. Why would I want to be a digi when Matt KD4PBS-3 has a wide coverage digi at 1,300ft level of a 2,000ft tower. Matt and I also have a UHF Voice Repeater at 1,200 feet on another tower which is the repeater I made the object for.

> Again, please understand that I do very much encourage and
> appreciate your effort to get these beacons on the air for

> where

How is the information supposed to get to the digi for the digi to announce the object? Is it not correct for an aprs station (like mine) to send that information for the digi to announce? Are the compliant digis supposed to maintain a database of objects pertinent to the area and they announce them by themselves only requiring an initial upload to the wide are digi to program it with the pool of objects it is poised to announce?

Thanks,

Sam Cederas

It's not perferred for a station like yours to announce that
infomation, as it uses 2x as much bandwidth, and could cause a
collission with another packet.

And Yes, the digi tnc's, based atleast on the kpc3+ can hold several
of those objects in it's memory, load them once, and you won't have to
load them again (unless something about the repeater changes, tone,
location, power, ...)

I am so pleased that you guys are engaging my questions. My goal is to have a thorough understanding.

Correct me if I am wrong.... the local wide coverage digi here at 1,300ft needs to have me send it some information about an object I wish to have it send out? So once the digi has the coordinates and txt I want for the object it will then start beaconing that objects information out periodically to alert users in range of the digi that there is a voice repeater on 442.075 with a positive offset requiring a 114.8hz tone located in apex,nc at 1,200ft at the specified lat & long. All of the information I just mentioned will be uploaded to the digi and in return the digi will send this out with an object specified by the code I send to this digi that matches the current standard. I will only have to send this to the digi once and then the digi will take it from there until told not to?

That seems to be what I am hearing you guys say. As it is now I am sending out this object over rf from my station which has it's path set to kd4pbs-3,wide2-1. which is the wide coverage digi in the Raleigh,NC area.

Sam,
The digi needs to be set-up to broadcast the object. That means setting up the TNC at that site with the correct parameters to send out the beacon. Hope that helps.

Dual posted to APRSSSIG as a reminder...

> Correct me if I am wrong.... the local wide coverage digi
> here at 1,300ft needs to have me send it some information
> about an object I wish to have it send out?

Ah, sort of. The data needs to be programmed into the TNC of that digipeater at that site (or via remote sysop mode by the owner).. Sometimes that is hard to do because 1) sometimes it is hard to find the owner, 2) sometimes the owner doesn't care, or 3)sometimes the owner disagrees, or 4) he is already using the 3 available local-object slots for something else. But from what I see of your area, most of the digis could use some re-tweaking of the parameters to be in line with current New-N recommendations.

> So once the digi [sysop] has the coordinates and txt
> I want for the object it will then start beaconing
> that objects information out periodically to alert
> users in range of the digi that there
> is a voice repeater on 442.075 with a positive offset
> requiring a 114.8hz tone located in apex,nc at 1,200ft at the
> specified lat & long.

Yes, You can help the SYSOP by preparing the exact text of the beacon in OBJECT format so that all he has to do is to type it into either the BTEXT or into one of the LTEXTS.
It also requires setting the BERACON EVERY command or the BLT command to 10 minutes and it also requires the UNPROTO PATH or the LTP for that LTEXT to be set to "APN382" (no VIAS) so that it goes direct. These objects should NEVER be digipeated from another digi. They should only be sent direct. The "382" is the version number of the TNC.

> I will only have to send this to the digi once
> and then the digi will take it from there until told not to?

You have to send it to the DIGI SYSOP and convince him to add it to his digi's TNC. In some cases this takes "once" in some cases weeks, or years, and in some cases we have to wait for the SYSOP to die first before someone can get to the site and change it.

> As it is now I am sending out this object over rf
> from my station which has it's path set to

> kd4pbs-3,wide2-1. which is the wide coverage digi
> in the Raleigh,NC area.

Great initiative, but with three important comments:

1) that path is abusvie to the network and the intent of these objects. It is going 2 hops in all directions via KD4PBS-3 and the second hop violates every intention of these objects. That second hop is SPAM into areas of other digipeaters where there is no chance that someone can hit that voice repeater. The goal is to ONLY hit the area where the voice repeater can actually be used. Anything else is SPAM and collides with other users of the channel.

2) It is good that you are doing your own object on an interim basis, but it is imperative that you initiate the process to get the local digi SYSOP to take it over and put it in his DIGI's TNC. And while you are at it, convince him to make his settings in accordance with the New-N paradigm (since 2004) It has been 6 years and all the world has upgraded to these settings, so we need to get those SYSOPS in NC to catch up and tweak their local network.

3) Once your receommended voice frequency object is in the digi and being served from there, then you should remove it from your home station to minimize channel congestion.

4) Finally EVERYONE in the APRS community in that local area, including the SYSOP of the digi serving this object should agree that whatever objects are being put out from the digi, are in fact, the consensus of the community as what is best for the travler to see on his radio in that area. We do not want unused, nobody-home voice repeaters being advertized in the only 3 avaailable slots when other more important voice repeaters used by travelers are not. On the other hand, any KPC3 digipeater can originate up to 3 objects without adding any load to the channel, so the groups should determine what those 3 objects should be for maximum benefit to travelers.

For proper format of the OBEJCT see www.aprs.org/localinfo.html

For proper DIGI setup see www.aprs.org/fix14439.html

Good luck
Bob, Wb4APR

Fantastic! Sounds like then you will have no problems getting
the sysop of the DIGI to then add your OBJECT for the voice
repeater into his TNC. Done.

> Are the compliant digis supposed to maintain a
> database of objects pertinent to the area and
> they announce them by themselves only requiring
> an initial upload to the wide area digi to program
> it with the pool of objects it is poised to announce?

BINGO! Yes. Every digi made using a KPC3 TNC has 3 slots for
these objects. We ENCOURAGE every DIGI to use them just for
this purpose.

The beauty then is the mobile traveler will always see right
there on his front panel what the local DIGI (and local users of
that area) recommend as the top-3 most valuable local ASSETS the
traveler might be interested in. And if you use the correct
format, then the traveler with a D710 only has to push one
button to instantly QSY his radio to check out that asset.

That is the big plan.
Bob, Wb4APR

Thank you SO MUCH for taking the time to fill my head with APRS Knowledge.

I have read over and over again the "APRS Local Info Initiative" page. Your answers here and the page I just mentioned have explained everything to me.

I really appreciate the time and effort that you and the others have taken to pass along much needed information for me. To borrow a phrase, "Knowledge is Power !"

Thanks again. I will now proceed with talking to Matt about the digi and will remove my local broadcast once this is done.

I have not found one with NMEA I/O (or any other kind for that matter....) and have not had the guts to go buy one to hack.....It would be a beautiful way to install a system. There are mobile PC's with DIN mount VGA monitors that are an alternative.

The OnStar system in GM cars does have a serial port but there is one small problem: If you set it to NMEA mode it will disable the OnStar system (though the GPS remains active). There are a couple hacks online for this. It requires a small modification but you can get the NMEA data from such a system and would be useful to anyone that isn't using their OnStar (i.e. no more subscription).

Some of the other navigation systems might suffer the same limitation. They may operate in the binary protocols of the GPS receiver rather than ASCII NMEA which would disable the base system.

Looks like it was a nice trip. I looked over your RAW packets. The only time it took three hops was a single QRMing duplicate.

Me thinks WIDE1-1,WIDE2-1 would be more courteous and conservative on the slow network.

Subject: [tapr-announce] TAPR at the Dayton Hamvention (May 15-16, 2010)

Dayton Hamvention is the biggest gathering of ham radio operators on the planet and as usual, TAPR has a full slate on tap for the Hamvention weekend (May 14-16, 2010).

TAPR Booths:

Booths 455 through 458 in the Ball Arena of the Hara complex is where TAPR presents the latest advances in the state of the ham radio arts.

TAPR Digital Forum:

TAPR Digital Forum runs from 9:15 to 11:15 AM on Friday in Room 1 of the Hara Arena with the following schedule of presentations, moderated by Mark Thompson, WB9QZB:

9:15 – TAPR Update by Steve Bible, N7HPR, and Scotty Cowling, WA2DFI

9:30 – WL2K Network and its RF Portals by Rick Muething, KN6KB, and Vic Poor, W5SSM

10:00 – TAPR Project Design for Manufacturing, by Scotty Cowling, WA2DFI

10:30 – Putting HPSDR on the Internet, by John Melton, G0ORX/N6LYT

11:00 – Wrap-up

TAPR-AMSAT Banquet:

Friday evening, TAPR joins AMSAT for their fourth annual joint banquet at the Kohler Presidental Banquet Center, Kettering, OH (just south of Dayton). Dr. Bob McGwier, N4HY, will be the after dinner speaker.

Doors open at 6:30 PM and a cash bar will be available. A buffet dinner begins at 7:15 and includes Salmon with Newberg Sauce, Marinated Roasted Garlic Rosemary Chicken Breast in Lemon Butter Sauce, Marinated Pork Loin, Scalloped Potatoes with Parsley, Normandy Blend Green Beans, Fresh Fruit, Green Salad, Pie, Iced Tea, Hot Tea and Coffee.

Make reservations for the banquet online at the AMSAT Store <http://www.amsat-na.com/store/item.php?id=100158> or contact Martha at the AMSAT office from 10 AM to 6 PM EST/EDT at 301-589-6062 or toll free at 888-322-6728. You can pick up your reserved tickets at

the AMSAT booth on Friday or at the door.

Date: 2010-04-30 13:32:34 UTC
From: Robert Bruninga
Topic: 7462 Message: 7462

Just noticed that every night I am getting plenty of APRS posits via ISS.

Apparently it has been on for several days now, and is coming over northern latitudes during the night starting about sunset local time. This pattern moves earlier about 20 minutes a day.

So if you want to check it out, just QSY your APRS station to 145.825 overnight and see what you get.. Turn the volume up and you will hear it come into view.

Can check its live downlink on www.ariss.net

Bob, WB4APR

>> What path do I use to transmit a beacon.

All of these should work:
VIA ARISS
VIA APRSAT
VIA WIDE1-1

Do not put any other hops in there like VIA ARISS,WIDEn-N bewcause all it does it lengthen every one of your packets by 7 bytes which is only a disadvantage when trying to get into a busy uuplink.

Actually, it ISS is set up as a proper APRS satellite, it should also recognize WIDEn-N too, again, so that a terrestrial hiker or wilderness traveler does not have to change his path when he does a brief operation via the ISS or other APRS satellite.

For operation via analog transponder satellites, set your baud rate to 9600 and y our path to NONE, no vias at all. Also set PTT mode so that your 9600 baud data burst goes out in only a tiny 120 ms data burst on the end of your voice call.

Sure, unless they are so poor that they cannot hear the ISS directly. And any IGate that cannot hear the ISS directly has really got problems... You can hear it on a wet noodle.

> Read someones blog that suggested using
> ARISS,WIDE2-2 so that the igates pick up
> the digipeated packets so to ensure they
> get routed to ariss.net

No. Wrong, bad advice. WIDE2-2 has no value after being digipeated by ISS and further if the WIDE2-2 path is used at all, then the packet WILL NOT BE CONSIDERED AS FROM ISS. Because the RS0ISS-4* tag is lost!

Fuurther, that is bad advice because it adds 7 bytes to evry packet, just adding useless load to the channel. A Mic-E packet is only 25 bytes long. Adding 7 bytes (for WIDE2-2 that has no purpose) reduces the channel capacity by 25% for no benefit.

See the original space docs www.aprs.org/APRS-docs/SPACE.TXT

Hi John,
I have the same problem.

This is the last beacons from the ISS I think.

2010-05-01 14:42:34 UTC: RS0ISS-4>CQ,SGATE,qAR,LW4DEM-3:>ARISS -
International Space Station (BBS/APRS on)
2010-05-01 14:46:34 UTC: RS0ISS-4>CQ,SGATE,qAR,LW4DEM-3:>ARISS -
International Space Station (BBS/APRS on)

Maybe it's not on at the moment.
Bob may be able to help.
Cheers,
Robin.

Just noticed that every night I am getting plenty of APRS
posits via ISS.

Apparently it has been on for several days now, and is
coming over northern
latitudes during the night starting about sunset local
time. This pattern
moves earlier about 20 minutes a day.

So if you want to check it out, just QSY your APRS station
to
145.825 overnight and see what you get.. Turn the
volume up and you will
hear it come into view.

Can check its live downlink on www.ariss.net

Yes, but there are also many listening on 145.825 too.
You can see their calls in each packet heard on www.ariss.net
after the Q construct.

Come to think about it, it woiuld be nice to make a list of th
em.

Bob,

That page has a link to http://web.usna.navy.mil/~bruninga/iss-aprs/issicons.html which appears to be unreachable, is that the right link?

I left my radio on overnight, starting around 1900 EDT yesterday, and the APRS station list was empty this morning. The ISS overflew my location (North Carolina, USA) around 1915 EDT. Is the ISS digi on all the time, or ...?

From: ve3tkb
Topic: 7477 Message: 7477

I have setup a APRS station at home using a MFJ-1270C TNC and terminal program to configure it. I have no computer hooked up to it.
This is my setup:

Mycall ve3tkb
Myalias WIDE1-1
beacon every 200
btext !4294.82N/8127.24W-PHG3250,London,ve3tkb(at)yahoo.com
unproto aprs via WIDE2-1

I can see my packets being digipeated but Findu is not reporting hearing my station, it has been up for 16 hours now.

Am I missing something?

Thanks in advance

> unproto aprs via WIDE2-1

It has a fatal flaw without the leading zeero for longitude.

Since it is serving as a WIDE1-1 digi, and if it will be used by nearby travelers, and since it has no active station attached to it, I think it should show a DIGI symbol with a "1" overlay. And it should say that in the text.

Further it should ID iteself once every 30 minutes via 1 hop only. This makes sure it is visible to someone in range of it, but it does not add QRM beyond that range. Your settings would be:

* beacon every 180 <== I think that is 30 minutes on an MFJ
* btext !4294.82N108127.24W#PHG3250
W1,London,ve3tkb(at)yahoo.com
* unproto APMFJ

> I can see my packets being digipeated but Findu is not
reporting
> hearing my station, it has been up for 16 hours now.
>
> Am I missing something?

Yes the longitude. But once you see yourself on FINDU, then please cut back the beacon to local simplex direct only. Since this TNC will not do callsign substitution, and so there is no other way to identify it.

Anyone can check, any time, anywhere by going to www.ariss.net.
If ISS is on the air, you will see up-to-date packets. If it is
off, y ou will see older packets.

Appraently it went off the air 2 days ago now.
Bob

OK, that worked.

At the end of the above URL there is a link to a navy.mil site, replacing the hostname with aprs.org did not work (resulted in 404).

The broken link is http://web.usna.navy.mil/~bruninga/iss-faq.html

Using APRS actually got me out of a speeding ticket today. I was on my way home and a vehicle similar to mine sped past me and a cop was in the median facing the other way. He pulls me over, i asked whats up. He did the usual licence reg and such and them he saw my laptop setup and look over my suv and asked what all the antennas were for. He then said he clocked me for speeding. I proceeded to show him proof of my speed and his jaw dropped the ground. He couldnt believe some of the stuff we use our radios for. Yet another mind educated. I love it...

Didn't Bob say this in an earlier post?

"No. Wrong, bad advice. WIDE2-2 has no value after being digipeated by ISS and further if the WIDE2-2 path is used at all, then the packet WILL NOT BE CONSIDERED AS FROM ISS. Because the RS0ISS-4* tag is lost!"

It seems that if Bob thinks that is wrong path...

Enlighten me John!

Date: 2010-05-05 20:34:26 UTC
From: Steve
Topic: 7462 Message: 7493

Hi

Can anyone point me in the direction of someone who can supply a very lightweight APRS system. Preferably a complete system GPS through to transmitter.

Or it can be modules if the complete kit is not available.

The basic project is to attach a paper airplane to a weather balloon, and release the plane. Then track the plane as it hopefully returns to earth then retrieve the plane and pictures taken.

Hi,

Thank you for this info on the APRS Forum. I will not be able to attend being too far away this time and other commitments for this years Hamvention.

Is there going to be some kind of video that some one could place somewhere on the Internet? It would be interesting to hear what the latest innovations that are in store for the future as well as what is going on presently with APRS equipment.

> Just wondering where to find list of frequences in the LA
> region thank you ? Especially accessable from LAX ?

For APRS, there is only one frequency in all of north america.
It is 144.39 MHz. Then if APRS is working like it is supposed
to, when you arrive at LAX, just turn on your APRS radio and it
should capture the locally recommended VOICE freqeuency for
where you are.

Unfortunately, many local areas still do not understand this
concept, and so you might not see any frequencies on your APRS
list. Too bad.

To see how it works, look at www.aprs.org/localinfo.html

Oh, and before you go, zoom in on any APRS system to an area,
and then look on the map or the station list to see any
recommended voice frequencys. For example, I just tried LAX
AIRPORT on aprs.fi but the map is so full, I don't see any
frequencies.

So I went to FINDU.COM and clicked on nearby stastions, still no
frequency objects...

7500. Igate setup help

Yahoo group: APRS (2007 — 2010)
Date: 2010-05-08 08:14:11 UTC
From: Kc7hgn
Topic: 7500 Message: 7500

Hello Group,
I have my UI-View station setup as an Igate. I do not think that I have it setup right. I am connected to http://sjc.aprs2.net:14501 So you can see me. I want to have NWS and Messages from about 100 Miles radius of me. I did have it set to all NWS to test and I recieve fine. Problem is, I don't know the NWS Station or info on how to Filter it properly. The other problem is that my Igate shows IGATE,MSG_CNT=0,LOC_CNT=16. I have seen other people around that show IGATE,MSG_CNT=79,LOC_CNT=34. So I don't think it is set right for messages. Maybe its my Unproto Path, or something else I don't know. Need some help here.
Thanks, Kevin

7501. Help with 30M AFSK APRS

Yahoo group: APRS (2007 — 2010)
Date: 2010-05-09 03:18:15 UTC
From: Wayne
Topic: 7501 Message: 7501

I easily got PSK-63 APRS Messenger up and running. I have seen and communicated with a number of stations. Stephen, WA8LMF-63 mobile on his cross country trip was very strong although I did not communicate with him as I was in the learning the software curve.
I then decided to try FSK AX.25. For testing I am running a Kam XL with a Procomm Plus terminal program. The Rig is an Icom IC-746 which was used for the PSK-63. The dial frequency on the radio is 12 HZ low so I set it for 10.147.612 USB. No filters are on. I could hear the AFSK but the bar graph stayed to the right side of the window and nothing was decoded. I then tuned around and found good reception and decoding of APRS stations with the dial set to 10.147.812 USB. I thought the Kam might be off on the 1600/1800 tones so I checked it with my lab audio oscillator and it is good. I have not tried to transmit any AFSK.
I would appreciate any information as to why I seem to have to tune so far off frequency or is there more than one APRS frequency?

Wayne, WA5LUY

That was not the worst place for a GPS to die. In 1999 my Garmin II died while I was on a search in the Great Sandy Desert in Western Australia! It was due to the GPS calendar rollover (like a Y2K event) and an update fixed it upon my return tho the States.

Well if you really wanted a new one...

On my GPS-II and GPS-III, I had the same problem and it was caused by the little coax that goes from the inside of the BNC connector to the receiver module. The center conductor came unsoldered or broke due to connections and disconnections and the BNC being a little loose. It's a pretty weak link, but not too hard to repair.

That said, for $25-50 or so you can get a newer and much more sensitive receiver so getting a replacement is pretty painless as Ham radio bits go.

OTOH, if you're going to the Hamfest, maybe you could pick up another GPS-II/III that doesn't lock for cheap/free and just resolder the antenna cable inside.

Happy shopping at the Hamfest!

I've had 2 Garmin Street Pilots of various flavors do the same thing.
Turns out they had "forgotten" where they were.

Going into the menus to try to manually set a location, one thought it
was in Australia, the other in Sweden. (Hint, zoom out to maximum view
to figure out where it thinks it is). Hence, they were "looking" for
satellites in the wrong places.

Once I used the arrow to select my actual location, the satellite
configuration updated and they were able to achieve a lock.

Took me a week or so to figure it out the first time it happened
(including opening up the unit to check the connections). It was the
first thing I checked when the Wife's unit went stupid, and resolved it
in about 2 minutes.

A little late for James, but hopefully this will help someone else.

It is the original E-Trex (yellow), i have to give this thing 5 stars because it survived 10 years of abuse, off road, 200+ to -20 temps while running 24/7 for 6 of the 10 years.

It was ok when i go the truck ready for the road trip that afternoon, but when i fired up the thing the next morning it would not lock, i left it alone for a while and then stopped, again same result, let it run for another 45 min and tried to mess with it again. The pixels were half gone and the display had started to fade away, It served me well for 10 years in the suitcase tracker. I will just find another etrex someplace at the hamvention, i do have 3 other APRS projects going on at home as well so i was planing on a total upgrade for the truck anyway. Ill take whats left of it home with me and use it for target practice in the back yard..

Of course the 8+ year old TT2 is still working fine, got to give that a 5 star rating as well.

read it, forgot about that, sometimes we do things rashly. And the refurbish information might help someone else.

Thank you for your comment.

Hello to all my name is JD. Im please to say that im finally getting my mobile APRS station going. slowly but surely. My garmin nuvi 350 arrived today. In the near future i plan on getting the open tracker from argent data, plus the cables for fleet managment. doesn anyone else run a setup like this that might point out anything i might be missing
thanks
JD

I'm not sure, but I believe the OT2m will offer a lot more bang for the buck with the Nuvi 350 than the OT1+. You might want to join the Tracker2 Yahoo group for more specific information and assistance.

Lynn (D) - KJ4ERJ - Owner of 2 Nuvi350/T2-135/Alinco DR-135s - KJ4OVQ-9 and KJ4ERJ-9

PS. And I'm about to swap one of the T2-135s for an external OT2m to interface with the Nuvi and APRSISCE simultaneously.

There's been a lot of discussion on the TM-D710_TM-V71 Yahoo group about this topic and the general consensus is that none exists and they've changed the protocol such that the ones for 700s don't work.

Hi JD,

I run two Nuvi 350's. One with the OT2m and one with the T2-135 in an alinco. The primary purpose of the Alinco is that it is running as a fillin digi.

I can attach the Nuvi to it to monitor the locals as they move about and I could take it to either a wildland fire or a USAR event and get APRS tracking for the emergency.

I think you would be much happier with the OT2m than the OT1. The OT2m has more capabilities and is the latest technology from Argent Data.

I gave a presentation of the Nuvi/OT2m combo at the annual RVing Hamfest at Quartzsite in AZ. I know that a number of these combos have been put in service since that presentation by Amateurs who live and travel fulltime in RV's

Actually, the DTMF external keyboard can work, it still takes DTMF input, but the problem is that the new D710 mic does not have all the programmable function keys on the mic. Therefore, yes, you can keyboard letters, but you still have to push multiple buttons on the front panel of the radio to do editing functions, hit enter at the end and so forth that it just is not worth it. Typing and pusshing buttons back and forth between the keyboard and the front panel removes all the advantage of a keyboard...

Hi all,

I got a message today telling my settings are wrong.
My mobile g0hwc-14
I seem to remember some time back when someone decided we needed
to change the UK settings someone told me to have both wide and
trace ? Well I guess most of UK is on new settings now ?
What should I have my mobile set to ?
I do cover all of the UK and sometimes need quite a few hops to
get into a I-gate.

D710 Frequency Whack a Mole:

We need everyone with a D710 to help mentor their fellow hams!

After driving 1000 miles with 20,000 mobiles to/from Dayton during the busiest APRS mobile days of the year, it is frustrating to see MOST of the D710 mobiles on the front panel and only 1 or 2 actually transmitting their voice frequency of their Band-B! This auto-identification of your voice monitoring channel is the number 1 new feature of APRS this decade, and somehow the point just is not getting across. The point of APRS is to facilitate communications for the traveler, this voice frequency annunciation and auto-tune is fundamental to this initiative. Im glad to see the Yaesu FTM-35o's starting to transmit their frequencies now too...

Further, after passing DOZENS of D700, or D710's and completely unable to contact them without HONKING THE HORN AT THEM, it is equally frustrating not to be able to raise them on Voice Alert. Unless they are looking right at you when you pass and see you waving the mic and flashing 52 (or other appendage), they are basically unreachable.

Please take a PERSONAL initiative to mentor your fellow operators. I suggest the following WHACK-A-MOLE approach by pre-loading these few mentoring messages into your D710 PHRASE memories. Then you can send these messages with just a few key presses. When you see sonmeone that needs mentoring, simply select them on the list, press MSG, press FUNCTION, and selct any of your 5 pre-loaded MENTOIRING Phrases.

PHRASE 1: for clueless D710 operators:

"Ur D710 not TXing ur Voice Freq. Pse consider STATUS #5, every 1/1."

PHRASE 2:. For anyone with their freq in wrong format:

"Ur Freq in ur BCON is not in auto-tune format. Pse Google APRS LOCALINFO"

PHRASE 3: For anyone with a 2-way APRS not reachable on Voice Alert:

"Are you monitoring CTCS100 Voice Alert on 144.39?

PHRASE 4: For D700 users who do not have APRS hot buttons on top:

"Activate D700 APRS Hot buttons under RADIO-DISPLAY-MODE-3. &
save it.

Good luck. If we don't help them, who will???

Hi Bob. I have a tremendous amount of respect for you and what you have done.

I refuse to accept voice alert. It never has made sense to me to introduce another method to interfere with data transmissions.

I just don't understand the reason why it is so necessary to talk on a packet frequency at all. The one packet that may be trounced on by voice could possibly be the one that was the most important for the station that was trying to send it.

> to interfere with data transmissions.

Thanks for the feedback... But...

But every time one transmits a packet he is interfering with other data.... So it is a matter of degree. And further, a voice alert call takes maybe 4 seconds instead of 1 second packet. Further, one might only do this once a week or month when one is traveling and wants to contact someone passing by. Remember, the real value of Voice Alert is that you can hear their pings when someone is in simplex range... Like a free APRS radar detector.

The interference potential of a rarely used 4 second voice call out of say 24x60x60x7 packets per week or an interference potential of 0.00006% of channel capacity I don't think is worth quibbling about, considering the huge benefit of making contact when needed.

> I just don't understand the reason why
> it is so necessary to talk on a packet
> frequency at all.

Because it is not just a packet frequency, it is the national APRS channel for mobile communications. It is the ONLY frequency that you can guarantee that another APRS mobile is monitoring. And so if you need to contact him, then I think it is perfectly legitimate to make a 4 second voice call to ask him to QSY to your voice frequency.

> The one packet that may be trounced on
> by voice could possibly be the one that was
> the most important for the station that
> was trying to send it.

We can say that about every packet on APRS. Every packet transmission most likely collides with some other data, but I think the purpose of the channel is to facilitate communications, and I think a real human-to-human voice call for 4 seconds (where contact cannot be made in any other way) is far more valuable than most single packets on APRS.

Remember, *the primary benefit* of setting Voice Alert is just making sure that people are LISTENING. Actually making a voice Alert call is about as RARE as dialing 911, or calling MAYDAY.

But in order for 911 or Mayday to be successful, there has to be someone montitoring. And the problem is that 90% of all APRS mobiles with real live humans at the operating position are not monitoring or reachable. This is a travesty of a national communications capability.

In my opinion.

From: Sam Cederas
Topic: 7525 Message: 7530

Sorry Bob I do not see it that way.

Interference is interference and besides how can you say that it is okay to transmit 4 seconds of voice on top of 1 second packets? Of course everyone knows that anyone who uses voice alert ONLY talks for 4 seconds MAX and no more. I cringed in my seat as I typed the last sentence cause I simply do not believe it.

Maybe I am too advanced because I know how to talk on a voice frequency if I need to in fact there are a ton a voice freqs to fascilitate that need. I can only imagine how annoying it would be for me to ride around with voice alert on because I like others have a good mobile antenna and I can hear A LOT of APRS traffic direct from other mobiles. Of the 8 stations I see listed as mobile right now in the immediate vicinity, I can hear most all of them direct in my vehicle. Boy how annoying would that be to listen to.

My suggestion is to turn it off on the 710 for the reasons stated previously and again because it is annoying. What is Voice Alert a solution for anyway?

when one is traveling and wants to contact someone passing by.
Remember, the real value of Voice Alert is that you can hear
their pings when someone is in simplex range... Like a free APRS
radar detector.

The interference potential of a rarely used 4 second voice call
out of say 24x60x60x7 packets per week or an interference
potential of 0.00006% of channel capacity I don't think is worth
quibbling about, considering the huge benefit of making contact
when needed.

I just don't understand the reason why
it is so necessary to talk on a packet

frequency at all.

Because it is not just a packet frequency, it is the national APRS channel for mobile communications. It is the ONLY frequency that you can guarantee that another APRS mobile is monitoring. And so if you need to contact him, then I think it is perfectly legitimate to make a 4 second voice call to ask him to QSY to your voice frequency.

The one packet that may be trounced on
by voice could possibly be the one that was
the most important for the station that
was trying to send it.

We can say that about every packet on APRS. Every packet transmission most likely collides with some other data, but I think the purpose of the channel is to facilitate communications, and I think a real human-to-human voice call for 4 seconds (where contact cannot be made in any other way) is far more valuable than most single packets on APRS.

Remember, *the primary benefit* of setting Voice Alert is just making sure that people are LISTENING. Actually making a voice Alert call is about as RARE as dialing 911, or calling MAYDAY. But in order for 911 or Mayday to be successful, there has to be someone montitoring. And the problem is that 90% of all APRS mobiles with real live humans at the operating position are not monitoring or reachable. This is a travesty of a national communications capability.

In my opinion.

D710 Frequency Whack a Mole:

We need everyone with a D710 to help mentor their fellow hams!

After driving 1000 miles with 20,000 mobiles to/from Dayton during the busiest APRS mobile days of the year, it is frustrating to see MOST of the D710 mobiles on the front panel and only 1 or 2 actually transmitting their voice frequency of their Band-B! This auto-identification of your voice monitoring channel is the number 1 new feature of APRS this decade, and somehow the point just is not getting across. The point of APRS is to facilitate communications for the traveler,
this voice frequency annunciation and auto-tune is fundamental to this initiative. Im glad to see the Yaesu FTM-35o's starting

to transmit their frequencies now too...

Further, after passing DOZENS of D700, or D710's and completely
unable to contact them without HONKING THE HORN AT THEM, it is equally frustrating not to be able to raise them on Voice Alert.
Unless they are looking right at you when you pass and see you waving the mic and flashing 52 (or other appendage), they are basically unreachable.

Please take a PERSONAL initiative to mentor your fellow operators. I suggest the following WHACK-A-MOLE approach by pre-loading these few mentoring messages into your D710 PHRASE memories. Then you can send these messages with just a few key
presses. When you see sonmeone that needs mentoring, simply select them on the list, press MSG, press FUNCTION, and selct any of your 5 pre-loaded MENTOIRING Phrases.

PHRASE 1: for clueless D710 operators:

"Ur D710 not TXing ur Voice Freq. Pse consider STATUS #5, every
1/1."

PHRASE 2:. For anyone with their freq in wrong format:

"Ur Freq in ur BCON is not in auto-tune format. Pse Google APRS
LOCALINFO"

PHRASE 3: For anyone with a 2-way APRS not reachable on Voice Alert:

"Are you monitoring CTCS100 Voice Alert on 144.39?

PHRASE 4: For D700 users who do not have APRS hot buttons on top:

"Activate D700 APRS Hot buttons under RADIO-DISPLAY-MODE-3. & save it.

Good luck. If we don't help them, who will???

Voice Alert is much easier and quicker than messaging, "K4OC, 146.520". We
can speak that in about 2 seconds. Safer too as usually we are driving.
I use Voice Alert in the shack as well as mobile. I recall a trip to MN when
I could raise nobody on the repeaters on the way, but I had 2 mobiles and 3
bases contact me using Voice Alert and we took it to another frequency.

Everytime you send a packet, it is interference. The APRS network is fundamentally a collision limited system. In fact the collision of packets at each hop is fundamental to the reduction of dupes, dozens of them, every time a packet is transmitted. If one is concerned about collisions, then the APRS network is not a practical place to be.

> Maybe I am too advanced because I know how to talk
> on a voice frequency if I need to in fact there are
> a ton of voice freqs to fascilitate that need.

Ok, but how do you divine what freqeuency another APRS mobile is on that you need to contact? It sure seems silly to me to not use a frequency you are 100% sure he is on (144.39), and if he has set voice alert, that he is actively monitoring.

> I can only imagine how annoying it would be for me
> to ride around with voice alert on because I
> like others have a good mobile antenna and I

Sounds to me like you have never tried it.

> ... Of the 8 stations I see listed as mobile right
> now in the immediate vicinity, I can hear most all
> of them direct in my vehicle. Boy how annoying
> would that be to listen to.

You won't hear any of them unless they are configured for Voice Alert. Most of them (I bet all of them) are not. You won't hear a thing. If you do, then bingo, one of them is in range and wants to make a contact.

On the other hand, if you have that many APRS mobiles, all running voice alert in a mile or two of your location, I am impressed. And if you have no interest in talking to them, or receiving a call from them, then clearly you should not run APRS voice alert locally. BUT it makes no sense to me to leave that local congested area, and go out on the open road to Dayton

Mecca and not enable it for the trip.

It is as easy as programming one channel in your radio on 144.39 without CTCSS 100 and another one with it. In fact, you could program a third channel with CTCSS of your choice (not 100) and then only your closest friends who knew your personal PL would ever bother you. I have used that in my wife and kid's cars. That way, they never hear antying from APRS, but I can still call them if I need to.

> My suggestion is to turn it off on the 710
> for the reasons stated previously and again
> because it is annoying.

How can it be anoying if you have never even tried it. Especially tried it while on a trip. I drove for 20 hours over 1000 miles and only heard 2 stations in 2 days to/from Dayton!

> What is Voice Alert a solution for anyway?

Making human-to-human contact between fellow hams looking to QSO.

Hi Bob,

I do not use the Voice alert philosophy because if I set the tone on many APRS signals do not reach my decoding TNC. The voice alert philosophy is only valid if you are in encode mode only. If you are in encode and decode then the signals are blocked because the tone is not present to open the receiver.

> Voice Alert is much easier and quicker than messaging,
> "K4OC, 146.520". We can speak that in about 2 seconds.
> I use Voice Alert in the shack as well as mobile.

As a reminder to everyone...
Please make sure you are not then transmitting PL 100 from your base!

Transmitting PL 100 along with your base-station APRS packets is the surest way to absolutely KILL Voice Alert in your area. ABSOLUTELY...

The reason is, a base station APRS transmits 24/7/365, and yet the operator is only in the shack maybe 5% of the time. The other 95% of the time, those PL 100 packets are being heard as FALSE CQ's by traveling and other LOCAL mobiles.

THERE IS NOTHING MORE FURIOUSLY FRUSTRATING than to hear a voice alert packet (basically a human CQ) and then to call back, and get no response. As a result, everyone running voice alert quickly gets frustrated and either turns off Voice Alert or worse, turns down his volume when in range of this base station. When a mobile turns down his vollume on his Voice Alert settings, Now he becomes another CALLING-CQ and NOT-LISTENING problem. And the damage is done. No one in that town will ever use it. And mobiles driving through get irritated.

Please. Voice alert is a HUMAN-TO-HUMAN CQ. It should never be on and transmitting when there is not a human present. That is why it is mostly a mobiles-only function. Hopefully, someone is at the wheel and driving.

For a home station, use a NON PACKET RADIO, set CTCSS 100 for receive only, and then you are safe. A GREAT way to monitor from the shack and be allerted to an APRS mobile in range.

Bob, WB4APR

In the subject line (D710), Voice Alert only applies to APRS
radios (D7, D700, D710 or other radios) where the TNC is
directly connected to the discriminator and is not affected by
CTCSS. The VX-8R does not allow one to set it on the APRS
channel. Im not sure about the DR and GR, or the FTM-350.

But please NEVER enable PL 100 ENCODE only on APRS packets.
That is a travesty of the concept. See my other posting on the
topic. NO ONE SHOULD EVER TX PL100 packets if they are not
listening to CTCSS 100 on the channel. Its like actively
calling CQ with one's receiver turned off.

Bob, I think it is a good idea, I have my TM-710 Configured for Voice alert, I think I have done it correctly, and I never hear anything that I shouldn't, but I have never heard anyone try to contact me either. but there could be a possibility that I don't have it configured correctly.

7537. Setting Voice Alert

Yahoo group: APRS (2007 — 2010)

> either... there could be a possibility
> that I don't have it configured correctly.

I did meet one person that said the same thing. But then after a lot of deep discussion found that he did not have it set up correctly.

Voice Alert is very simple on the D7, D700, and D710. It simply means:

1) Have APRS in Band A
2) Tune to 144.39 (in America)
3) Turn the volume up high
4) Set CTCSS 100.
5a) Save this as your main APRS channel
5b) Save an a 2nd channel the same, but with NO TONE and NO CTCSS.
5c) Save a third channel with a PRIVATE CTCSS (not 100).

This way you have THREE modes of APRS operation:
5a) Voice alert normally (unless too many locals cause too much noise)
5b) Wide open for listning to the channel for troubleshooting
5c) For ALWAYS QUIET. 5c) Can also be used by trusted agents to still call you.

The power of having all three is that this eliminates any need to EVER turn down the volume on APRS band A which makes you miss calls unknowingly. And a voice alert station with the volume down is worse than no voice alert at all because he is calling CQ and not responsive.

FINALLY. Do NOT turn on VOICE ALERT in the D710 menu. Doing this LOCKS band A into Voice alert ALWAYS and makes it impossible to monitor the channel or to turn it off without going back to the menu. This was a bad design. So never use it. Instead, program the 3 memory channels above and you get full flexibility and function.

Hi Bob,

I think Voice Alert is a great concept! I did two trips from NH to AR and back, and, like most, I know how to use my radio to make contacts etc.

My first trip was abismal! I made one contact through a repeater and that was it, and I tried very often.

My second trip I consider a success. I programmed Voice Alert into my FT857D and just listened for a packet to get through the PL decoder.

When I got into Maryland I heard a packet (in fact it startled me!) and quickly established a Voice Alert link and moved to 146.52 and ended up with a 10 minute QSO with someone camping in Greenbrier State Park. When we were finished I went back to monitoring 144.39 and made no other contacts for the remainder of my trip. I only wish I could remember the call. It was exciting to make the QSO!

Both of those trips was done with a APRS radio that did not easily support Voice Alert. My current radio does! My next trip I will be running with Voice Alert running!

Funny thing, when I am on the road, amateur radio provides a great place to talk to myself. It is kind of like running my 900MHz radio. Voice Alert can make a difference! Try it, you may like it! If nothing else, program in your regular voice 2M for 144.390MHz frequency and turn on 100Hz encode and decode. You just might be surprised!

I would like to get into APRS, but don't have an APRS equipped radio, so would like to find a complete unit, TNC GPS with the most functions possible, for both Mobile and HT use. Radio I would use for now would be my FT-2800M mobile and my FT-60R HT. A plus would be If I can also connect to my computer and see other APRS units during Radio Club Events, maybe use also as a digipeater. Is there such a unit available?

7540. TNC Suggestions (formerly Setting Voice-Alert)

Yahoo group: APRS (2007 — 2010)
Date: 2010-05-19 20:21:57 UTC
From: Lynn W. Deffenbaugh (Mr)
Topic: 7525 Message: 7540

With that list of desires, I'd have to say either the OT2m or the TinyTrak4. You won't be doing Voice Alert with anything except a dual-band Kenwood radio, however. Unless the new dual-band Yaesu FTM-350r mobile can do it.

Both the OT2m and TT4 will hook to the microphone and speaker jacks on your two radios, probably with two different radio cables terminating in a DE-9 at the TNC end. I believe the same cable might work with either the OT2m or TT4 as they share a common radio port pinout.

OT2m - Great when paired with a Nuvi350 for GPS and APRS Messaging/display

TT4 - Can hook directly to a 16x4 display and PS2 Keyboard for local display and messaging

The OT2m using a hardware decoder which does well for 1200baud AX.25 decoding. The TT4 uses a DSP-based software decoder meaning that it can possibly be extended to other over-the-air signaling as firmware becomes available.

The OT2m is open source firmware, so you can build your own if that's your schtick. The TT4 firmware is only available from Byonics.

I'm sure other's will offer up their own opinions, but that's my $0.02 for whatever you consider it to be worth.

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile and Win32
Owner of both T2-135 (OT2m equivalent) and TT4

7541. New tracker/radio cables and OpenTracker+ bundle

Yahoo group: APRS (2007 — 2010)
Date: 2010-05-19 20:51:56 UTC
From: Scott Miller
Topic: 7541 Message: 7541

We've finally got some factory-made radio and power cables in stock to connect the OpenTracker+ or Tracker2 (or TT3/TT4, for that matter) to most popular handheld radios. We're also introducing a bundle that includes the OpenTracker+, radio cable, and GPS receiver for $99:

https://www.argentdata.com/catalog/product_info.php?products_id=143

The cables are available separately here:

https://www.argentdata.com/catalog/index.php?cPath=21_32

More cable types to come.

Scott

I just picked up a pair of VX-8GR's (couldn't wait for Kenwood) .and NO you can't set the CTCSS for channel B with the A12 (APRS 1200) on. BUT, there is no reason channel A can't be used as Voice Alert with the CTCSS tone squelch on. Yes, a waste of the second channel - but it would be nice if you were trying to meet up with someone.?? (BTW, #2 son get the second VX-8GR so we can tweet at the Boy Scout Jamboree - and wife/mother can see tweets on the internet, too - yes, I should have purchased four. but I want to live!)

To: APRS@yahoogroups.com
Subject: RE: [APRS] Re: D710 Whack-A-Mole!

In the subject line (D710), Voice Alert only applies to APRS radios (D7, D700, D710 or other radios) where the TNC is directly connected to the discriminator and is not affected by CTCSS. The VX-8R does not allow one to set it on the APRS channel. Im not sure about the DR and GR, or the FTM-350.

There are a group of regular APRSers here in Albany that use voice alert all the time, me included (when I'm listening in my vehicle). I can tell you that it works and it works well. We users will call the beconing station and most times will be able to have a conversation. Occasionally while out of the area I hear stations using voice alert that are listening and that will yield a QSO too. More times than not voice alert stations are not listening, may be on another frequency, have the volume turned down, or just have things set incorrectly. I can't understand why this is so complex.....

When I gave a talk on APRS to my local ham club, I suggested that when driving, ALL hams set ONE of their scan frequencies or the B side of their radio to listen for voice alert. Even if they are not APRS capable, they can still hear the tone when another ham is in range. I recommended that they call on 144.39 saying something like "Calling station using voice alert, this is K2QY". This then opens up a large group who are not APRS capable but can still benefit from hearing the tones.

BTW, for those that are concerned about interference, and while yes that does happen, the APRS signal actually overpowers the voice transmission most times. I'm guessing this is because it seems to take less energy to get a packet through than to get a voice tranmission through. This is one of the reasons why those realy low powered trackers work so well.

Anyway, just my 2 cents.

I may be misinterpreting what you are saying, but if you are saying that you are actually chattting on Voice Alert, then that is a definate no-no. It is only to make a very brief call. Something like:

"WB4APR voice Alert, QSY 52"

That will let the other driver know you want to make a contact, and telling him where to go. If you have 146.52 PROgrammed into your side A CALL channel, then all you do is hit CALL button and do the QSO. Done.

You MUST say Voice Alert every time you make a call on that cahnnel because if you don't, the other person will not know you called him there, and will assume your voice came in on his band B and he will go there and you will fail to communicate. THIS IS IMPORTANT.

7545. D700 and D710 settings

Yahoo group: APRS (2007 — 2010)
Date: 2010-05-20 00:51:46 UTC
From: Robert Bruninga
Topic: 7545 Message: 7545

I put all the D700 and D710 settings on my web page:

D700: www.aprs.org/D7xx/d700-faq.txt
D710: www.aprs.org/D7xx/d710-setup.txt

This one includes saving 146.52 in BAND-A CALL channel for quick
voice alert transition to 52 (in the call channel on side a)
without having to go back to band B to QSO.
You would use this technique if you were the Voice Alert CALLER
(on side A).

If you are the callEE, then you are on band B and just dial in
your 52 channel to respond.

I hope I got it all.

From: MichaelC
Topic: 7546 Message: 7546

Hi all,

A while back I built a simple voice alert radio.
Bob WB4APR made the suggestion and this was my follow up on the subject. It is made out of common items and as a project it's fairly 'cheap' to build.

It has been out with one client who had good results in the N. Virginia area. He did not have any problems with it.

It truly needs a bigger test.
Someone who drives for a living perhaps?

http://www.flickr.com/photos/90108848@N00/sets/72157622719434778/

It's available to anyone else who will get some hours on it.
Figure on a three month test.
I can program some area channels in it for you.
Get the scan list going and add the APRS ID data injected into the controller. That way it's truly 'plug and play'.

Feel free to get back to me at

ka2zev@...

Thanks in advance.
Mike in VA

Thanks Bob for that complete and all in one place set of instructions.

I was having a problem following the main thread, 'D710
Whack-A-Mole!', as there was too much QRM.

Why do folk quote the whole of a previous posting? It makes following
a thread difficult.

From: Robert Bruninga
Topic: 7548 Message: 7548

Start planning for this years national APRS Golden Packet Event.

25 July 2010 we want to get APRS hikers and outdoors types to
activatge as many of the long natinoal hiking trails and try to
send APRS messages over hundreds of miles. See the web page
www.aprs.org/at-golden-packet.html

The Appalachian Trail teams will form again this year.
Does anyone want to coordinate the Pacific Crest Trial?
The Contental Divide Trail?
The National Trail (Lewis can Clark trail)
Any others?

There are 50,000 miles of long linear National trails.
Climb or drive to one near you to participate.

Of the 14 teams for the Appalachain trail, 12 were drive-up, so
this can be a non strenuous event for most people and it only
lasts 4 hours or so on a Sunday.. But if you are a hiker, your
skills will be valued at many of the harder to reach sites!

Start thinking about it...

I need some coordinators for each trail..

Bob, Wb4APR

7549. D700 and D7 HF operations!

Yahoo group: APRS (2007 — 2010)
Date: 2010-05-22 13:23:40 UTC
From: Bob Bruninga
Topic: 7549 Message: 7549

Whilewe are talking about configuring one's D700 (or D7), do not forget it can be used as an HF control station if someone in the area has a TS-2000 enabled with "generic" skycommand.

This way, everyone in a club or group can use their D700 mobile rig to control or monitor HF. Using generic settings, all of their D700's see the TS-2000's front panel at the same time. Usually only one person is controlling, but at least everyone can see the virtual HF rig on their D700/7's front panel.

If they tune in the link frequency, they can hear the HF, and can push PTT and talk and can SEE on their D700's the HF front panel frqeuncy and modes. Think of it as a group HF operation round-table but everyone can share the mic.

See www.aprs.org/skycommand.html

Another often overlooked capability of Sky command is that ANY radio with an external TNC and a laptop can also do it, The links are simply audio on VHF and UHF and the controls are PL and CTCSS and of course PACKET. Just use Hyperterm program and you can manually send the packet commands to control the radio and to SEE the modes and freq.

If someone in your club has a TS2000, twist his arm to let everyone use it while he is not.

Same path. Your objective in out-of-area messageing is to
simply make sure an Igate hears you. And there SHOULD be an
Igate associated with every digipeater, or at least every
-other-one so that a 2 hop path anywhere on the planet will get
out to the world.

7558. RE: [APRS] Question about Messaging

Yahoo group: APRS (2007 — 2010)
Date: 2010-05-25 04:51:52 UTC
From: Armour, Randy (ITS)
Topic: 7553 Message: 7558

I am no expert on this subject, so the statements below may be corrected by someone more knowledgeable.

An APRS message (originator) must be heard by a local Igate to be injected into the APRS-IS system. This is the easy part, as it is the primary function of an Igate. If you see message data on Find-u, Open APRS, APRS.FI, etc. your message made it into the APRS-IS system. Example: http://www.findu.com/cgi-bin/msg.cgi?call=W7AI-8 <http://www.findu.com/cgi-bin/msg.cgi?call=W7AI-8>

The more difficult part is successfully delivering the message from the APRS-IS network to the recipient via radio. Some (not all) Igates are configured to listen to the stream of data on APRS-IS and forward any message designated for a station that it has heard recently via radio. If the intended recipient station has not been heard by an Igate that is configured to gate "to radio" as well as "from radio" in the last few minutes, the message will fail to be "gated" and delivery will fail. The most likely culprit is that no properly configured Igate exists in the message recipients local area.

From: Robert Bruninga
Topic: 7553 Message: 7560

Yes, we must get ALL Igates to
1) Be TWO-WAY
2) Not be configured to transmit unwanted SPAM into the RF local area.
3) Never have a path bigger than ONE HOP (except in extremly unusual instances).

There is big confusion. An Igate is always supposed to be enabled for two-way operation (that is the only way the APRS network can deliver messages to end recepients).

On the other hand that should be the ONLY thing that goes back to RF. All of those ego feeds of spam from everywhere else must be DISABLED except in very isolated islands where it might get turned on occasionally for demos...

Another thing to enable back-to-RF is the local IRLP or Echolink node. These informative objects are being generated automatically by the Echolink system into the APRS-IS so that each Igate can selectively add that NODE to the pass-to-RF list to serve the object to the front panels of nearby mobiles.

Those are all fine points, but what mechanisms exist to prevent denial of service attacks from the Internet side on two way Igates?

By DoS attacks I mean flooding the local RF spectrum by fabricating the right kind of packets and shipping them off to Igates.

That is clled APRStt or APRStouchtone. If soemone is running APRStt (currnt version is APRSSpeak) in your local area on a VHF channel, then all you do is pre-program your callsign into a DTMF memory on your radio and then anytime you want to be seen on APRS, you just switch too that channel and send your DTMF calllsign. This will put you on the map in APRS.

You can also send messages etc. See www.aprs.org/aprstt.html

But this APRSSpeak was only demonstrated at Dayton this year, so it is not yet ready for full deployment. See www.aprsspeak.com

Many new Igate operators activate their Igates and want to
show-off the power of their Igates by activated feed-to-RF all
kinds of categories of packets on the APRS-IS. They think
bringing in all this content and putting out this data on local
RF shows to all their friends a 'value' to APRS interconnected
to the vast resources of the internet.

But all it does is jam the local channel, collide with local
users and generally make APRS practically useless in the area.

Igates should be two-way, but only to the original intent of
allowing messages to come from the APRS-IS back to RF via the
local Igate that is nearest to the recepient. No other packets
should be gated to RF with the few exceptions I mentioned of the
ONE and ONLY local Echolink or IRLP or WinLink object (if it is
being originated on the APRS-IS).

Each Igate has different set-up options, and so maybe someone
will post specifics for each type of Igate.

Bob who is this committee of "we" you reference. I have no right nor you to make anyone who provides a resource for APRS to make them bear the burden of NOW having to allow Internet traffic to be transmitted from their station to RF.

Implementing security protocols consistently amongst an enterprise topology requires significant resources and that cost money.

Unless you are in a position to compensate Ham Radio Operators for their resources I strongly suggest that you tone down your ideals.

This is a hobby and not a business.

Yes, we must get ALL Igates to
1) Be TWO-WAY
2) Not be configured to transmit unwanted SPAM into the RF local
area.
3) Never have a path bigger than ONE HOP (except in extremly
unusual instances).

There is big confusion. An Igate is always supposed to be
enabled for two-way operation (that is the only way the APRS
network can deliver messages to end recepients).

On the other hand that should be the ONLY thing that goes back
to RF. All of those ego feeds of spam from everywhere else must
be DISABLED except in very isolated islands where it might get
turned on occasionally for demos...

Another thing to enable back-to-RF is the local IRLP or Echolink
node. These informative objects are being generated
automatically by the Echolink system into the APRS-IS so that
each Igate can selectively add that NODE to the pass-to-RF list
to serve the object to the front panels of nearby mobiles.

Those are all fine points, but what mechanisms exist to prevent denial of service attacks from the Internet side on two way Igates?

By DoS attacks I mean flooding the local RF spectrum by fabricating the right kind of packets and shipping them off to Igates.

Well, let's see....Bob developed the protocol and provided it free, for all of us to use. What are these resources you speak of? Nobody is asking you (or anybody else) to Gate to the internet. He is just asking you do it properly. It will cost you nothing more. As the developer I'll bet old Bob knows allot more about the mode then you or I ever will. Probably, when you and I do, we will be famous like Bob and maybe they will ask us to speak at Dayton....
I asked a question and Bob as well as the rest of the folks who have posted have been very helpful to me. Why did you decide to crap in my Post?

If you don't like Bob's ideals, maybe you should consider Bird Watching, instead.

7571. Re: Question about Messaging

Yahoo group: APRS (2007 — 2010)
Date: 2010-05-26 08:15:06 UTC
From: Michael
Topic: 7553 Message: 7571

Hi Steve

Properly not much additional value add to all the replies on you messaged, but just examples that sending messaged over large distances do work in the current APRS infrastructure.
There is no doubt that trying to get a messaged beyond 3-4 hop on RF path alone is hard to achieve in an area with medium load on the APRS channel.. This mainly due to packet collision. You can read more about this thinking and the aloha circle on Bob's homepage and several other.
So sending a messaged to some one on 400 Miles away or on the other side of the planet in a more reliable way, you can look at the APRS network as isolated islands in terms of RF. A island with the size of where your 2 or 3 hop path will get you.. The person you like to send a messaged to are on a similar island... What connect those 2 are igate and the internet.
Making the messaged a success you first need to ensure that there are an active igate on your "island" (can your packet be seen on internet, both positions and messaged check with APRS.fi) Then you could check if there are an igate available on the "island" you try to send the messaged to (an indication will be that you can see the intended receiver on APRS.FI as well, but not a guarantee as you can not see if the igate are bidirectional and configured to trap messaged) From there on it is only to try. Send the messaged as you will do if the receiver was on your "island"

In this way i have used APRS on several business trips around the world.. I have been parked just outside Texas motor speedway having a conversation with a guy 20 miles NW of Copenhagen Denmark some 4000-5000 miles away. This involved several messaged bask and forward and was faster then using SMS (have to be said, that the guy in Denmark was on UI-view directly connected to internet but would have worked to his car as well as his Igate whould trap the messaged and relay it to RF). I also used APRS messaged from Dayton hamvention couple of weeks ago to just test the link back home, to same guy as above in Denmark. It worked all well and was properly 6800 KM (i don´t bother to calculate in miles). Biggest issue there was when at Hara areana that the APRS traffic level was so high that I had really hard times getting heard by a digipeater due to collision with other and more powerfull stations and from there get to the Igate. When at our camp site in New Paris around Richmond having trouble reaching a digi with my 5W and the antenna on the rental.

So i am a "happy camper" sending messaged home from Florida, Texas, Ohio, Finland, Germany or where ever i go.
In order to do so the point Bob makes about not having Igates every where that gate all traffic to internet are very important.. it is importaint that the igate do trap the messaged send to some one in the area with in one hop. But it is totally irrelevant in most cases to gate the trafick from other "RF Islands" to one own "island"... I do not need to know driving to work in Copenhagen Denmark where the local repeater in Orlando Florida is or where Bob are driving. if I need to know I will go to internet and APRS.fi or other site. So on RF in my area only the traffic that can make it there via Rf is relevant. Anything else (With the exception of messaged) will make the APRS channel to crowded. Something that result in lowering the fun, as the the small local stations will get harder

and harder to get heard...

Well, the "we" is amateur radio and the goal of APRS is an all volunteer network to facilitate communications among radio operators.

> Unless you are in a position to compensate Ham Radio
> Operators for their resources I strongly suggest
> that you tone down your ideals.
> This is a hobby and not a business.

I agee. Its a volunteer network to help our fellow hams to communicate callsign-to-callsign anywhere on the planet. My post was to make sure that everyone that operates and IGate understands that they are part of the network and their IGate is critical to enabling APRS message connectivity to local hams in their area or equally importantly, passing through.

It should not require any additional resources. Just set "gate-messages-to-RF" to ON in one's IGate. Do NOT enable any other SPAM-to-RF unless you are on a remote island that wants SPAM, QRM and an overloaded network.

This should not be burdeon on anyone interested in supporting the network...

Does anyone have any experience with the new MFJ TNC? There are no reviews posted on the eHam. The TNC looks interesting since it uses the USB port, eliminating the USB to Serial converters. Also with the MFJ1270DG plug in, makes the TNC a stand alone digi. Sounds interesting combinations, only if it works that way! Thanks, Stan - K8SRB

If you are looking for a low cost stand alone digi, this also looks interesting:

I believe the new MFJ TNC and the TNC-X referenced here are the same thing with MFJ perhaps licensing it from the developer of TNC-X, at least I hope they didn't steal it from him, it has been around for several years
You should be aware that both of these are KISS only TNCs and require some form of host program to operate(Like AGWPE, i.e. they won't work by connecting it to a standard RS-232C serial port.

Also the version sold by the developer is much less expensive than the one sold by MFJ.

Date: 2010-05-26 19:55:20 UTC
From: Wojciech
Topic: 7579 Message: 7579

I am going to interconnect Tigertronic TM-1 tracker with my Kenwood TS 480, possibly using the DATA socket in the radio.
Any suggestions from amateurs who have done this will be appreciated as the original TM-1 manual shows how to use the mike socket only.

Regards,

Tom, VK2OE

From: k6acj
Topic: 7573 Message: 7584

Found the command for switching radio ports, to change the packet conversation data stream from the 1200 radio port to the 9600 radio port, type ~a then the message, to return to the 1200 radio port, type |a. Abaud is for the PC serial port, not the radio ports on the 9612, I'm working at the other end of the TNC. Anyway, Kantronics calls the command the stream command and to make matters worse, the Kantronics User Manual PDF is not searchable, strange !

So there it is. The KPC9612+ will simultaneously receive from a 1200 radio and a 9600 radio on the appropriate ports so that's why a software command is necessary to direct the conversation data stream to the correct radio.

PS: the Kenwood TH-D7AG seems to RX and TX at 9600 but it takes 3 menu settings to make it happen.

Technically a USB to serial converter hasn't been eliminated, it's just hiding inside the box instead of being exposed and dangling out the back of your computer. When you plug in the TNC you will likely discover that a new serial port gets installed for the converter chip that is inside the TNC. And more likely than not it's the same type of chip used in stand alone serial converters (either Prolific or FTDI).

From: w0rmt
Topic: 7588 Message: 7588

Greetings all-

I'm finally selling my D7, as I just don't use it any more and could use the money (we just had twins :)).

I have for sale a TH-D7A(g) (s/n 30700298) of which I am the original owner. It is in very good shape, at least 9/10 cosmetically, and has never had any problems whatsoever. The radio has been MARS/CAP modified. Included in this sale are the following:

-The radio, stock antenna, wall charger, boxes and all manuals
-1 Comet SMA-24 whip antenna
-1 9.6V 1000 mAh NiMH battery (W&W manufacturing)
-1 9.6V 1450 mAh NiMH battery (Batteries America)
-1 BT-11h 6xAA cell battery case (Batteries America)
-1 brand new Kawa heavy duty speaker mic
-1 homebrew PG-4W radio programming cable
-1 Kenwood soft case for the radio

Price is $325 plus shipping. I will accept postal money orders, but can also do PayPal (prefer not to- if so, add 3% to the total cost).

Please contact me off-list with any questions.

Bob,
My two cents on two way traffic (inet - rf & rf - inet)
on the i-GATE AND MESSAGES.

I do one way from local to inet. I did adjust the script to allow two way messages tonight and I could not believe the impact on the ISP connection in doing so. I turn it back off. I think some modifications to the JAVA script need to take place to limit the message traffic to only traffic destination to users in your area.
The block must also include the ability to block certian types of mail traffic like blind messages.

I wouldn't have an issue keeping 2 way open if its truly traffic in and out of my area. I have experimented with JAVA commands but so far I haven't found the perfect fit.
its simple really.
my filter is setup as m/30 e/k*/n*/w* p/n/k/w (only us stations and within a 25 mile radius of my qth)

I still see a ton of traffic from other stations outside of the us. The traffic isn't destined to us call sign.

Hi Mark,

Forget about VMware, just a memory and resources hog...
I installed, in this order, XCode 3.21, download from Apple, OpenSSL, then Macports.

Just install everything correctly, follow all instructions, when done, type from Terminal...sudo port install xastir...works perfect.

Good luck in any way you install it.

7592. Mobile APRS WX Stations

Yahoo group: APRS (2007 — 2010)
Date: 2010-05-30 16:02:52 UTC
From: Bruce C
Topic: 7592 Message: 7592

I am trying to plan a Mobile Weather Station. I have a couple of problems.

1) Although wend direction is not as important as speed, most of the sensor packs have both a wend vain and an anemometer. I need to be able to pull the direction that the car is pointing from the GPS and adjust the wend vain reading before is processed. I don't see that capability in any of the existing software packages.

2) I see that some of the Weather Stations are APRS compatible. I don't see a GPS input however. I think that they are designed for stationery stations that can have the coordinate hard coded.

3) I have carried mobile anemometers before . I have had the problem of driving toward a storm front and hitting the fore wends suddenly. The combined interstate speeds and the speed of the wend is engulf to damage cheep anemometers.

Any comments would be appreciated.

Thanks,
Bruce

First suggestion, sign up on the Xastir mailing list at
www.xastir.org

Second: Go into the HOWTO's section on the Wiki there and read up
on OSX installs.

Third: Ask on the Xastir list if/when you hit snags.

Do you mean a wx station that is mounted on a vehicle and used while
the vehicle is stopped or used when moving?

> 1) Although wend direction is not as important as speed, most of the sensor packs have both a wend vain and an anemometer. I need to be able to pull the direction that the car is pointing from the GPS and adjust the wend vain reading before is processed. I don't see that capability in any of the existing software packages.

I have bought an Oregon Scientific WMR100 to mount on a Land Rover
camper while stopped. But so far I've not been able to find any
suitable software to integrate it with APRS.

When a GPSr is stopped it's indicated direction of travel will vary as
the location calculated wanders around. So it will not indicate the
"direction that the car is pointing".

My Garmin 78CSx and others with a built-in compass can o/p the compass
heading in a special sentence.

$HCHDG - Compass output: the value of the internal flux-gate compass.
Only the magnetic heading and magnetic variation is shown in the
message.

The GPSr needs to be mounted horizontally for this.

I would have thought that wind direction was more important than it's
speed, although both are required for forecasting.

However if your requirement is for a moving situation, the
calculations to convert combined wind direction and speed with the
vehicle's direction and speed to produce true wind direction and
speed; would be rather complex, I would have thought.

Regretfully, I've found that everything Windows that I've bought that
requires it's location to be entered, does not provide this from a
GPSr. I could do this with any DOS software, but I can't with
Windows.

Reg

Although this function has probably been automated now on the more elaborate WX stations i doubt that you will get it built into an inexpensive home WX station.

When doing navigation services in the Coast Guard in the late 60's and 70's we did vector plots to correct from indicated wind to true wind speed and direction.

Don't forget that if your vehicle is in motion you will have to factor in the speed of the WX system platform; i.e. the vehicle.

If your plan is to stop any forward motion prior to getting your WX info then you could create a simple mount for the anemometer that will allow you to turn the base so that the vane indicates north properly. I live fulltime in an RV and I use a mount that lets me rotate the base enough to compensate for my house changing its heading each time it is stopped. I take the anemometer down when in transit and when I put it back in place when stopped I simply align the vane with north. I use a threaded stock on the mount that lets me align the vane with north when I screw the anemometer back onto the mount on the roof of the house.

We use a Davis one wire weather station mounted on a tripod for weather spotting. It's a nice way to set up and break down in a hurry. Some of the wireless stations have a dongle that you can hook up to the laptop but they are way more expensive.

Subject: [APRS] Re: Mobile APRS WX Stations

Although this function has probably been automated now on the more elaborate WX stations i doubt that you will get it built into an inexpensive home WX station.

When doing navigation services in the Coast Guard in the late 60's and 70's we did vector plots to correct from indicated wind to true wind speed and direction.

Don't forget that if your vehicle is in motion you will have to factor in the speed of the WX system platform; i.e. the vehicle.

If your plan is to stop any forward motion prior to getting your WX info then you could create a simple mount for the anemometer that will allow you to turn the base so that the vane indicates north properly. I live fulltime in an RV and I use a mount that lets me rotate the base enough to compensate for my house changing its heading each time it is stopped. I take the anemometer down when in transit and when I put it back in place when stopped I simply align the vane with north. I use a threaded stock on the mount that lets me align the vane with north when I screw the anemometer back onto the mount on the roof of the house.

From: kc0rey
Topic: 7597 Message: 7597

I run UI-View here in the shack. I want my shack APRS station to run 24/7/365. In order to do that now, I have to run the computer 24/7/365 to do that.....
I have this fear the computer will catch on fire if I leave it on while I sleep (Back in 1997 I had one do exactly that.

So, currently I am running UI-View to control my Kantronics KAM Plus All Mode in KISS mode and the TNC is plugged into a Yaesu FT-2500M. This works well...as long as the computer is on.

I am running Windows7 so no Terminal Program. I downloaded TeraTerm VI and have it configured so that it reads everything the radio hears.

I need a configuration file that will work on my Kam Plus V.7.0. I've poured over the manuals and I think the only way I am going to make this happen, is to see if anybody will be willing to copy their configuration (commands) so I can make this station run independently of the computer. If there is a way to make it support Digipeting that would awesome as well.

Thanks in advance,
Steve KA9MOT-1

I'm pretty certain we'll be needing a complete definition of "station run independently of the computer". What exactly is it that you want "the station" to do? You mention digipeting as if that's an add-on feature, so what's the base features.

If you're expecting UI-View type displays, that obviously needs a computer (or at least a cell phone/PDA with APRSISCE). If you're expecting IGate activity, that'll need more than a TNC to do the Internet side of things. If you're talking just beaconing your location, what's the point in that if you're not at "the station" to receive any message traffic or observe what's going on around you?

I'm just wanting my TNC to do what TNCs do and run the rig with-out the computer. I do want it to Digi. I guess that is all I want it to do, and with more reading I am seeing that that may not be possible with Version 7.0. It does appear that I can add mycall to my mobile, and portable ARPS path and get it to digi that. Either way, I'm experimenting, playing and learning new things.....Isn't that enough of a reason? I also live in a rural area and I see that I can't always hit the local digis. The really good ones are almost 40 miles away. It would be nice if mine could digi me at least to the ones with better coverage.

You can not run APRS as a stand-alone on the KAM Plus ver.7 you need to have ver 8.2 in order to run APRS on it. The only way you can run APRS with the KAM Plus is with something like UI-View in KISS mode.

Or perhaps an embedded Linux box with OpenWRT or similar loaded
running Digi_NED, talking to a TNC in KISS mode. Check out what
OpenWRT runs on... You might have an old router laying around that
could be re-flashed into service.

Or an old DOS box running Digi_NED.

Hi Steve

Now i do not know the Kantronic modem, have not seen it on APRS in Denmark.

But i do have a alternative if you like to run a cheap standalone digi.

My remote digi in my "summer" house are a old ASUS wireless router, that are configured to run A linux distribution rather then the standard firmware. On that a APRS Igate and digipeater Sw called APRX are running making all the logical APRS work. On the HW site the router are modified so a simple kiss modem are integrated in to the router... (you option could be to just add a DB9 connector to the router and connect that to your current modem. (The routers that works with this have a Serial port build in, that is no accessible from outside the box.

With this setup you have a wireless router (yes the original functionality are still there + some), that can operate as a digipeater and Igate it you like.... If the router functionality are used it is connected to internet anyway (Not required, mine are running with out Internet and i am not using the router function), then it can igate to internet as well.

So it use very little power and if you anyway need the wireless functionality then you pay very little extra for the APRS.

You can find more info from.

The Linux distribution: http://www.openwrt.org

The APRS SW: http://wiki.ham.fi/Aprx.en

My digi running the SW are OZ5DIN-2

My Router have been modifyed and the Sw installed by OZ1EKD and OZ7HVO that also have designed and assembled the TNC used and build in the the Router.

7604. Mixed Packet LAN?

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-01 14:38:37 UTC
From: Mark Ford
Topic: 7553 Message: 7604

Hi all,

I have an idea... I would love some feedback on this. Folks with a more sophisticated palate of skills, please feel free to chase this on your own this is just an idea.

SUMMARY:
We have APRS. We have packet e-mail. We have the Internet. What if we weave them all together to form a remote LAN that can allow users without a persistent Internet connection to share data and interact with each other using sophisticated web tools, while allowing simple data to move over packet radio? For a working title, call it a Mixed Packet LAN. (Assuming nobody has already figured this out...)

VISION:
Create a stand-alone LAN (server, router, small number of laptops) that uses the LAN server for rich media (e-mail applications, etc.) and for accessing raw data over a packet radio connection. (It¹s a mix of regular intranet packets and radio packets, which leads to the working title of a Mixed Packet LAN.) Only the data moves over the radio the web based functionality is all served locally.

CHARACTERISTICS / DESIGN PARAMETERS:
This system is designed to be small, flexible, and powerful. In more concrete terms, it would be:
* Portable: no big desktop machines laptops only. If a team can transport the gear in their backpacks, that¹s good.
* 12V Power: All parts should work in the field, and that means power from a variety of sources land line, generator, car battery. The common denominator seems to be 12VDC.
* Open Source: Having commercial systems for this would be nice, but the pieces and the design constraints don¹t fit what¹s currently available.
* Platform Independence: Any device should work with this network and be able to access the Mixed Packet LAN server Mac, PC, iPhone, etc..

DESIGN:
The key to the Mixed Packet LAN system would be a small server running on a laptop. This server would have multiple roles database, web, e-mail, application, Wiki, Google Maps, and WiFi Rush dashboard. It would have two network connections one to an Open Mesh router node, the other to a ham radio TNC.

The connection to the Open Mesh router node would allow the Mixed Packet LAN server to be a ³stand alone Intranet² for 25-30 laptops. Two key pieces of functionality would be a web based e-mail program and a simple database front end design tool. The web based e-mail would feel like the web version

of e-mail that we¹re familiar with think Gmail. The database design tool would allow medium-level users to design surveys or data collection pages. This allows the 25-30 users to log into the server, bring up the Mixed Packet LAN server home page, navigate to a data collection page, and enter data. Other laptops on the network would be able to see summary views of the data. At this point, everything described exists in a standalone intranet.

Now for the connection to the outside world.

The connection to the ham radio TNC would allow the Mixed Packet LAN server to upload and download data e-mail messages, data from the database, and other stuff with a remote gateway connected to the Internet. Data would pass between the remote gateway and the Mixed Packet Lan server according to a priority list; I assume e-mail traffic would receive the highest priority, weather and housekeeping traffic would be transmitted more infrequently.

The Mixed Packet LAN server would handle all user management. This would include user accounts, network throttling, max upload/download quotas, etc.. (Basically what you would find on the Open Mesh dashboard the Coova or WiFi Rush options.)

APPLICATIONS:
I think this type of hybrid system with a persistent standalone intranet connection in the field and a thin, intermittent connection to the outside world would have a number of applications:
- EMERGENCY: Teams could set up this kind of system in the field to gather and analyze data. Specific applications could include everything from search and rescue to long term disaster relief efforts.
- RESEARCH: Field research by science teams or high school classes would have a handy tool for entering and analyzing data as well as staying in touch with the outside world.
- EVENTS: Many ham radio clubs provide communication for various charity events. This concept would allow clubs to provide data gathering and analysis as well. For example, names and times for bike riders or relay runners as they cross a checkpoint. That data would be available to family and friends waiting at the end, sponsors at home, or a medical team trying to find an injured person.
- DANCE: Just to consider other options and show the flexibility of this concept, consider a high school dance. The Mixed Packet LAN server would serve music files to all the networked devices including iPods and iPhones. The Mixed Packet LAN server would send playlists to other Mixed Packet LAN servers, which would serve those music files to all the devices on that network. Therefore two LANs in separate regions are all playing the same music file, not because the music file is sent from one server to the other, but because the play list is shared between the servers.

Thoughts? Feel free to forward as necessary.

Thanks,
-- Mark KB1MSA

I have to wonder, given the number of computers sold versus the tiny number of ham radios sold, what is more likely to be a problem:

A computer catching on fire? Or a ham radio catching on fire?

You might want to install an extra smoke detector over the radio. Although, when some camping gear in my closet self-combusted, my nose caught it well before the smoke detector. And when the folks down the hall had a kitchen fire, the smoke detectors (plural) still hadn't gone off when I found a foot of smoke inside my own hallway. The cheap ones apparently aren't worth the price of a match to burn 'em.

7607. Voice alert

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-01 16:12:49 UTC
From: Stephen M. Shearer
Topic: 7525 Message: 7607

I tried Voice Alert on a trip from Delaware to Cape Cod this last weekend - with no pings. (yes, the volume was up) I did talk with someone who was calling on 146.52 in RI.

I guess one thing I need to change - when using VA - is to limit the range of stations on the D710 "hit" list and maybe I can call them if they list a monitoring frequency.

Road traffic was heavy so it was a good thing my YL drove for a good chunk of the drive - it was nice to check the weather stations along the way.

WLNK-1 email is my next problem. it seems Igate stations don't port to RF?__

Yes, not only D710's but also FTM-350's now can automatically beacon their voice band operating frequency. The advantage of this over Voiec Alert is that the range is maybe 50 miles through a repeater instead of 5 miles simplex.

Did you pass right by anyone using APRS? I often will just scan the list for people heding my way. Just look at their direction from you and if their COURSE is the reciporcal, then they are probably on the same road heading at you.

But unless they are running voice Alert or are beaconing their actual D710 or FTM350 frequency, good luck raising them.

Bob, WB4APR

7611. Voice Alert in Europe (T136)

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-03 13:35:07 UTC
From: Robert Bruninga
Topic: 7611 Message: 7611

Seeing several references to:

>> Europe, Finland, Ireland: 144.800 MHz Voice Alert = 136.5 Hz.
>> While we've adopted 136.5 here in Ireland...

Yes, 100 Hz was fine for the USA with a 60 Hz grid and 60 Hz TV scan rate, but in some countries in Europe, harmonics of 50 Hz power grid and mrgawatts of 50 Hz PAL TV RF would give false squelch openings on 100 Hz.

So for Europe, Voice Alert is 136.5 Hz CTCSS.
We need to make sure that all documents reflect this.
I just went through and corrected my web page
http://aprs.org/VoiceAlert3.html

And I invite everyone to update theirs as well. It will take me time to correct all of my other documents, but I will. If anyone disagrees that T136 is NOT the standard European Voice Alert, lets battle it out now or forever hold your peace.

Further, Notice that in APRS we refer to tones by their whole-number values and ignore the decimal point. All tones these days are generated by special chips and so we only use their frequency as a reference, not as an exact need to specify the exact frquency. No one gives a hoot whether it is 136.5 or just T136. They dial in whatever their radio has in that slot.

That is why APRS has standardized on the 4 byte format of "Tnnn" for specifying PL or CTCSS tones instead of CTCSS 136.5 which takes almost 3 times as much bandwidth!

Bob, Wb4APR

Yes, I had VA working on 144.39 APRS (T100) and monitoring 146.52 at the same time. On other trips up/down RT95 I have had little to none in activity on APRS with voice alert. It may be that I am making the trip on a weekday, but traffic was heavy last Friday when we made the trip North.

The ideal way to travel!

But if you are not monitoring "52" on side B,or are scanning,
then another neat setting is to have 146.52 saved in the CALL
channel on side A of the D700 or 710 so once you make a call
"Voice Alert listening on 52" you can just push the call button
on side A (APRS side) and make the QSO with one button.
Otherwise you have to go back to side B and then find "52" in
your memory channels...

This is why I enjoy having repeater objects out there on the RF waves.

I travel with 144.39 on side A of my 700, and then the local listed repeter, Preferably an IRLP so that folks tracking me from home via the internet know which IRLP machine to dial up to find me, as when I travel outside my home city I always put the repeater I'm listening to on Side B in my Status Text.

Mark,

Off and on I have been working on some code in VB.net. Mostly grabbing KISS frames and doing a simple text display of the data in a table. This parsed data could be sent to a text file in CSV (comma seperated values) format. This could then be imported into a spreadsheet.

Several years ago, I had this code working under VB6 and I brought it to the community, offering it as a starting Windows application. I was torn to shreds by the C++ fanboys, the cutting edge coders and the I-Just-Have-To-Complain-To-Complain crowd. I set it aside and then a month later the drive crashed and I lost everything I wrote.

I am now learning VB.net and decided to work on this code again. I had to re-write everything and I have the KISS RX code working. I have yet to start on the TX code again. I have a working program for download at my site:

http://www.ke4nyv.com/software.htm

This program allows you to paste in a KISS formatted frame and covert it to TAPR2 format. Eventually, I want to include this code and the TX code into a single program to at least display and log the packets, as well as simple transmit function. I have no working knowledge of map programming, so that is something I have yet to tackle. I did, however, have a simple plotting method working, but I lost that code in the crashed drive as well.

Doesn't have to be compiled, but usually that's more efficient. You
could use Python or Perl to snag data, parse, and populate a
database.

Take a look at APRSWorld. I think his stuff was open-source.

There may also be some stuff on SourceForge or other places that are
open-source APRS parsing libraries.

Hi Jason,

Wow looks like lots of progress! Even if work is lost with crashed drives, the learning you did it putting it together still will help you with the next version!

My ultimate goal is to create a server on a laptop that can connect to a router and serve maps with APRS position data to an intranet (local LAN users only.) Applications could include serving maps to a group of hams camped out for Field Day, who all have their laptops.

I’m starting to learn about MapServer, the open source GIS resource. I want to be able to parse APRS data and drop it into MapServer.

As for C++ vs VB.Net... I want whatever the approach is to be something that high school students could realistically do (if motivated to play with stuff like this) even if it’s not the “best” solution.

I want to be able to parse data from a TT4, which can accommodate external sensors and send down that additional telemetry.

How does this connect with your approach?

From: Mark Ford
Topic: 7586 Message: 7620

Hi all,

I have a couple Tiny Trak 4 units that need firmware installed. I am a Mac user (OS 10.6) and would like to use that operating system if at all possible. OSX does have a terminal application, but it¹s for accessing stuff on the computer, not for talking to an external device.

So here¹s where I need a little help. Does anyone know of a good terminal program for the Mac? I¹ve looked at Zterm, but that seems pretty old and out of date...

Thanks,

Hi
looking for a little direction on setting up a new Digi for our area.

I want to put local information in the beacon text to alert APRS users of the local voice repeater but seem to be having some problems.In my tests monitoring my test Digi with Ui-View32 the object for the local information displays my call sign not the frequency, It also removes Digi object. Is this problem a matter of the way Ui-View handles the data or is it operator error on my part. Below are my digi settings.
I am hoping this is the correct forum for this, if not please forgive this post. using KPC3+ version 8.3
Thanks, Al Redding Ca

I have Doug Cox's USAPhotoMaps and it is great for tracking.

There is one feature I cannot get to work. Under "Internet/Network" is the option to "Act as an Igate" For an upcoming public service event, I'd like to act as an Igate while tracking the rovers and recovery vehicles but I haven't been able to get that function to work.

Anyone out there able to help me?

7624. 220 MHz band APRS?

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-03 22:03:37 UTC
From: bill-cahill@att.net
Topic: 7624 Message: 7624

At Dayton this year I noticed the new Jetstream 220MHz radio... an interesting play for Jetstream as this is the only radio they currently have on the market. And I got to thinking... would there be any advantage to doing any APRS on 220?

I know the whole point is to have everybody on one calling frequency... but it seems like a waste not to use some of this mostly wide open bandwidth. I wonder if it could be used for some high-reliability (lower chance of interference from dumb trackers) hops between digis or something -- a back country backbone if you will.

Just curious. I have only been playing with APRS for two years, with dumb trackers (sorry Bob!) but thanks to some miscreants in Tulsa who decided to break into my truck at a hotel and steal everything that wasn't bolted down, I now have a new Kenwood 'D710 coming... so I look forward to learning more and more...

7625. Garmin eTrex navigation still usable when connected to TinyTrak?

I'm not familiar with USAPhotoMaps and you didn't mention what RF hardware you'd be using or what Internet connection you might have, but you might consider APRSISCE for both Windows Mobile and Win32. It uses OpenStreetMap.org maps and does bi-directional IGating right out of the box. It handles KISS TNCs without a problem along with direct D710 support in the development version.

Check out the Wiki at http://aprsisce.wikidot.com/ and join the APRSISCE Yahoo group at http://groups.yahoo.com/group/APRSISCE/ to download your free copy.

> T107 R40m Net We630PM Mtg2ndSat

Your object name is only 8 bytes. It must be 9 bytes. Add a
space on the end and it should work.

Also We630PM wont fit perfectly in the 10x10x8 format which is
potimized for mobiles.... I'd use

T107 R40m Net W@630 Mtg2ndSat

It should show as
T107 R40m
Net W@630
Mtg2ndSa

The sat doesn't fully fit, but the info is there...

7628. Re: Terminal Program for Mac?

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-04 21:00:23 UTC
From: watchtinker
Topic: 7586 Message: 7628

Zterm works fine, but hasn't been updated in quite a while. There's also CoolTerm for the Mac. It's fresh and works well. If you google, there's some other things you can do, but I wasn't happy with those (too complicated and no better than CoolTerm).

Hope this helps,
Michael

7629. Standards for SSID's

Ok, so I have looked all over the web for a SSID's agreed upon standard. Everywhere I look, someone has a set of different SSID's. So my question is, is there an actual standard for SSID's in APRS?

I am also starting a personal APRS web site. I have great sources for UI-Veiw and all of its Addon packages. Also great source for AGWPE. Does anyone have any other web sites or sources that might be usefull? An APRS beginer page will be my most important priority. Thanks in advance.

> information.

I recommend APRS.ORG It is the original source of APRS information, though some people do not like its evolving lack of optimum organization.

But there is a link there for every single aspect of APRS. And for the standards and protocol, see the addendms 1 and 2. www.aprs.org/aprs11.html and aprs12.html

Anyplace that you find other information and opinions about APRS that conflict with aprs.org, lemme know so I can see if my pages need updating or if we can resolve the differences. There is just too much APRS stuff out there that can be missleading.

hi all
in EU we use this

SSID -0 (no SSID) should be used for all fixed stations (home-qth)
SSID -1 should be used for all sorts of gateways (IGATE, Sat-Gate,
HF-Gate and so on)
SSID -2 should be used for APRS-WIDE-Digipeater (which are
digipeaters with aliases of (WIDEn-n)
SSID -3 should be used for APRS-FILL-IN-digipeaters (aliases of WIDE1-1
only)
SSID -4 2nd fixed stations (2nd Home-qth)
SSID -5 should be used for WX stations
SSID -6 APRS via MOBILEPHONES
SSID -7 should be used for special mobile stations (truck, bicycle,
motorbike, Jeep, bus, RCV ect., NOT for normal cars)
SSID -8 should be used for fixed, portable stations and Boats
SSID -9 should be used for normal cars
SSID -10 should be used for Sat-stations (using APRS via satellite)
SSID -11 should be used for TCPIP stations
SSID -12 Balloon, Aircraft
SSID -13 unassigned
SSID -14 truck 18 Wheels
SSID -15 SW

Date: 2010-06-05 15:45:28 UTC
From: Bob Bruninga
Topic: 7629 Message: 7634

Unfortunately, I disagree with the EU list below. It violates some conventions dating back from 1995 or so, and it implies a draconion attitude of thow shalt.... and it violates the -11 which has been used for ALL high altitude balloons for over a decade.

I would state this list as follows:

HIGHLY (STRONGLY) RECOMMENDED and STANDARDIZED!
-0 for your primary fixed or message station
-7 for human portable (Ht's, portables etc)
-9 for your primary mobile
-8 for boats or your secondary mobile
-11 exclusive to balloons or aircraft
-12 for APRStt, DTMF, RFID (non APRS sources)
-14 for professional trucks and heavy travelers

HIGHLY SUGGESTED
-1 through -4 for digis, Igates or other fixed sites
-6 for Phones, Crackberry's, and other toys
-10 other
-13 other
-15 other

Though I will accept a standard for WX STATIONS if we can all agree on one. ANd maybe some other suggestios for the final 3, but I have visitors coming, and cant dig deeper right now.

It's a user group fer cryin' out loud. The whole point is to ask your question so other who may be able to answer that question can help you. If you ask for replies off list, nobody else gets to learn from those answers. Post your questions in a User Group or other Internet Forum and take the time, make the effort to come back and see your answers.
User Groups and Forums are for everybody. If you want private messaging I suggest Yahoo Messenger.

This is called Internet Etiquette, You wouldn't get on the radio and fart loudly into the mic would you? Same difference. Well, you're a Winlinker....you might.

Some user groups are EXTREMELY picky about what you post. If it isn't 100% on topic you get flamed. Hence the etiquette in politely asking. A 9600 baud question would see appropriate to the group to me.

Lynn,

Thanks for your input.

USAPhotoMaps was written by Doug Cox (KI6NLA). It uses the USGS topo maps and aerial photos from Microsoft's Terraserver. The APRS functionality displays heard stations and plots tracks for the moving ones. While some of the maps are dated, they show important data missing from street type atlases.

I am presenting using a FT-8800, Kantronics KPC-3+, Dell laptop with Windows XP, and WildBlue satellite service. The radio will soon (I hope) be replaced with a single band one dedicated to APRS work (those familiar with the FT-8800 will understand why That Is A Good Thing).

From: K9UDX
Topic: 7623 Message: 7640

I have been doing more research into why Doug Cox's USAPhotoMaps' "Act as an Igate" does not work. It does properly log my station onto a Tier-2 server. The server receives data but no packets. My present hypothesis is that the program is not properly formatting the data before it sends it to the server. I have been unable to find the details of how the packet should be formatted. Should it be in AX.25 format? Can someone point me to the information I need? Thanks.

7642. Spain Prefix Map

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-05 21:46:14 UTC
From: Lynn W. Deffenbaugh (Mr)
Topic: 7642 Message: 7642

Ok, I just achieved my Extra license here in the US in preparation for a trip to Spain. The ARRL International Operating guidelines document says "When operating abroad, you must identify your transmissions by giving the foreign call district in which you are travelling followed by your US call (e.g. ?This is G3/W1AW)."

I've been able to track down that Spain is the EA prefix, and I've also found a textual reference for EA1-EA9 (http://www.ac6v.com/prefixes.htm#E). What I'm looking for is a map with these regions outlined.

I'm primarily going to be operating APRS and am ready to change my beacon text as I transition regions, but I really need to know where those regions are geographically speaking. Does anyone out there have any helpful hints or pointers?

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile and Win32

From: Amir K9CHP
Topic: 7642 Message: 7643

While in Canada, I was told that with aprs, since the prefix or suffix
will not work, it can be ignored as the location is an integral part
of the transmission. I think that the logic would work in Spain too.

Ok, sure glad to hear a positive reply. I have been hammered where politics takes priority over common sense like our Winlink project in Orange County hence the need to look for a real expert for 9600 packet. Yes, I'd like to share the info about 9600. I'm trying to get 'best practices' for 9600 packet (APRS & winlink is packet) because our 9600 packet appears slower than 9600. ACKs are slow coming back from the main node. To take full advantage of the speed 9600 offers, the TNC must be properly configured and the TNC TX audio output to the radio must be adjusted for the correct deviation. Unlink APRS, Winlink packet requires fast TX/RX response to data and handshaking protocol. Anyway, I'm using a Kantronics 9612Plus TNC and Alinco single band data radios, one each for 145 (1200 packet)and 431 (9600 packet). I have no comment on the Alincos.

After searching the internet for a 440 Packet frequency plan I find non. We are operating on 431.1 but I'd like to do my testing on a separate frequency but without some idea of a band plan I am reluctant to twist the dial to another frequency.

thanks .... Bill k6acj

7646. Re: Spain Prefix Map

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-06 05:07:52 UTC
From: k6acj
Topic: 7642 Message: 7646

I went to Spain twice with my VX-7R and Elecraft KX-1, 8 trips overall. The main page to RadioAficianados de Espania is http://www.ure.es/ .... Its a well made site with regional maps but the site has changed since I last used it 2 years ago.

For 2 meter repeaters you'll need to enable the 1700 hertz call tone on your radio to start the repeater. Unless you speak Spanish most of the 2 meter hams are shy OR they are taxi drivers using ham radio. I found I could open a repeater from the castle in Segovia and from high in the mountains south of Granada. I have not heard APRS in London, Madrid and points around and south of Madrid to Granada and the southern spanish coast en route to Valencia. However I know there are many hams in the Valencia and Barcelona area. Also there is a large HF station just a block north of the Atoche Train Station in Madrid, maybe its a foreign office.

Puerto Rico had decent APRS ... just thought I'd add that note.

Have fun .... Bill k6acj

Topic: 7629 Message: 7647

Ok guys,
Thanks for the great info. It looks like APRS.ORG and APRS.NET are in agreement for the SSID's except for -11 and -12. I personaly like the APRS.NET version and the Web Site is much easier to navigate. It took me a long time to find the SSID's page on ARPS.ORG. I am going to reference my page on APRS.NET. Also, I would like to suggest we use -1 for WX or maybe -13. The SSID on APRS.NET for -0 is should reflect "None" instead of -0. A little confusing since it does not work. What do you guys suggest?
Thanks, Kevin

I like -13. 10-13 stands for weather status in some version of 10 code.

Regarding SSID's:

I may have come across a terse in my response yesterday, but I was late to a family gathering as I was writing it. Here is my more thoughtful answer, and maybe some ideas for improvement... and a HOPE that we can get everyone to agree to the common list.

From aprs.org/aprs11.html (currently having ISP problems).

-0 primary fixed and message capable station
-1 digis and other fixed stations
-2 digis and other fixed stations
-3 digis and other fixed stations
-4 digis and other fixed stations
-5 TBD <= maybe Dstar/Echolink/phones/Ipads etc
-6 Satellite,special events, usuaual tests
-7 HT's, walkie talkies or human portable
-8 boats, sailboats OR second vehicle
-9 primary Mobiles of all types
-10 operation via the internet (Igates)
-11 balloons and aircraft
-12 DTMF, RFID, or other non-APRS sources
-13 TBD <== Weather has been suggested)
-14 Truckers and full time road warriors
-15 HF <== I suggest making this ANYTHING ELSE

I like the suggestion of WX stations as -13 and -10 for Igates. I like keeping 1-4 and 15 free for other home stations, digis, 3rd cars, etc...

In contrast, I think some on APRS.NET need to change as suggested.

http://info.aprs.net/index.php?title=SymbolsAndSSIDs

-0 Home station, or a home station running IGate.
-1 Digi, home WIDE1-1 and/or WX Digipeater
-2 Digipeater on 70 cm <== too restrictive
-3 Digipeater
-4 HF to VHF gateway <== no longer important
-5 IGate (not home station) <== prefer move to -10
-6 Operations via satellite <== expand to "events"
-7 Handheld radios ... plus D-Star, etc
-8 Boats, sailboats
-9 Mobiles
-10 APRS-IS only - APRS with no radio <== lets add Igates
-11 APRStt (and balloons) <== No. Balloons/aircraft only!
-12 Portables,laptops, camps <== no. Is now DTMF and RFID
-13 Not defined <== lets make Weather
-14 Truckers <== or other full time drivers

-15 HF stations <== lets expand to include anyTHING

I'd vote for it.

By they way by -0 do you mean the same thing as 'no - and number' or can
you really use a -0? Can't say I've ever seen a -0 but I've seen several
with no dash and no number.

Hi Bob, I have a question. I have been using -12 for portable operation. This is when I am on my Airstream RV as opposed to my mobile (-9) and home (-0). Using your suggested protcol, what SSID is recommended for on site RV operation? I only use -12 when the RV is on site. If I am towing, I have a unit (-9) in the truck. (-0) and (-12) are never in operation at the same time. Thanks and 73, Joe Thompson

It occurs to me that it would be handy to identify xmit-only trackers/beacons somehow, if not by their SSID. The station/beacon types described for each of the SSIDs in the list below provide some clue as to how that station is operated (e.g. as an IGate, as a mobile station, as a Digi, etc.). The only beacon type station from the list below that might be unattended (i.e. where there's not likely to be an operator nearby or available to communicate) would be the ballon, but airplanes are also included (whose pilots, may or may not be available by Ham radio, so that's probably consistent).

Having a separate ID for aeronautical stations seems resonable, but I think it'd be helpful to identify terrestrial, transmit-only beacon stations as well. Maybe repurpose -4 or -5 for that if those current definitions are no longer useful?

Just a thought.

>"When operating abroad, you must identify your transmissions by giving >the foreign call district in which you are travelling followed by your >US call (e.g. “This is G3/W1AW)."

AFAIK, there are no call districts in Britain (the quoted example), so that example should be replaced by ARRL. You'd use M/W1AW in Britain (I was told so when I was there some few years ago).
If it is regulated in the reciprocal agreement between USA and Spain, you'd need to find that map, if Spain has callsign districts in the mainland.
For _european_ visitors to other european countries, is't only necessary to give the national prefix (e.g. SM/LA2BBA). Most will use an additional number when staying in a separate island group or otherwise separate territory, e.g. EA8 for the Canarys, OH0 (Oscar Hotel Zero) when in Åland.

IN APRS, the callsign field cannot contain a slash. You let your callsign as it is, and enter EA5/<your call> first in the status text (somethong else than 5 if you are in another call district)

-8 is ideal for that. Not much difference between a boat and an RV. It means someone it out there with something expensive and unusual and enjoying Ham Radio from it.

I'm also expanding -6 to include special events or activities, so -6 might be a good one if we can standardize on it.

Bob

as opposed to my mobile (-9) and home (-0). Using your suggested protcol, what SSID is recommended for on site RV operation? I only use -12 when the RV is on site. If I am towing, I have a unit (-9) in the truck. (-0) and (-12) are never in operation at the same time. Thanks and 73, Joe Thompson

I agree. I'm thinking maybe the -15 could be the default for that one...

Bob

The station/beacon types described for each of the SSIDs in the list below provide some clue as to how that station is operated (e.g. as an IGate, as a mobile station, as a Digi, etc.). The only beacon type station from the list below that might be unattended (i.e. where there's not likely to be an operator nearby or available to communicate) would be the ballon, but airplanes are also included (whose pilots, may or may not be available by Ham radio, so that's probably consistent).

By using lots of different SSID's with what sounds like the same vehicle you run the risk of lossing messages. If (as an example) I use -9 when I'm mobile and -12 when parked. I will lose any message sent to -9 when I switch to -12.

Actually, that would be the fault of the hardware or software you're using. aprs101.pdf says that messages should be captured and displayed based on the callsign w/o SSID, but acks should only be sent by the station with a matching -SSID.

What is your -12 station made up of?

I've found when utilizing my laptop at work to send messages that if I leave my mobile station on in the car in the parking lot there will be a whole list of all messages sent to me on my laptop. I've found that the Acks dont' always come back, but the messages get through.

Topic: 7629 Message: 7663

The problem arises when one has more than one tracker. I have 3 TX only trackers. (Currently -11, -12, and -13) They show up with the mic-e on my D700 display, which always tells me when I'm looking through stations that they're tx only and can't receive anything back. I also set up the comment with a repeater or my e-mail that I can be reached by when they're in operation. Normally these are only in operation during special events when tracking key components of the event (normally fundraiser rides/runs), or when testing new programing settings.

I'm all for standardization, but sometimes conflicts will occur with the standardization, for example, when I deploy all three of my trackers, they'd conflict with the same SSID, so having 1 or 2 flexible SSID's could be handy.

of course, I think we're all using some sort of symbol as well, so that could be helpful in clarifying those particular undefined SSID's

Can we get some more consensus on this issue of the "-0"? I notice that aprs.fi removed recognition of it from his system, but some systems recognize it. What is the story? If I put it in my home system (iGate) then I cannot see the system on aprs.fi, but can elsewhere.

By they way by -0 do you mean the same thing as 'no - and number' or can you really use a -0? Can't say I've ever seen a -0 but I've seen several with no dash and no number.

I would agree that the -0 seems redundant.

Subject: [APRS] Re: Standards for SSID's

Can we get some more consensus on this issue of the "-0"? I notice
that aprs.fi removed recognition of it from his system, but some
systems recognize it. What is the story? If I put it in my home
system (iGate) then I cannot see the system on aprs.fi, but can
elsewhere.

By they way by -0 do you mean the same thing as 'no - and number' or can
you really use a -0? Can't say I've ever seen a -0 but I've seen several
with no dash and no number.

What software are you running on your home system (iGate)? If it is transmitted AX.25 packets, then -0 and no -SSID are EXACTLY the same in the AX.25 header. If it is transmitting some other format, then from my reading of the spec, the S/W should be updated. If it's UI-View (as it appears based on your raw packets), then the S/W cannot get fixed, but the configuration of it can.

Still looking for knowledge.

What should an Igate forwarding a packet from RF to the internet insert just before the data? Is it "qAR,<call sign" or (as uiview appears to do "<call sign>I"?

(I did find a error in the code).

This was wrong as the 3 has never been required.

> AFAIK, there are no call districts in Britain (the quoted example), so
> that example should be replaced by ARRL. You'd use M/W1AW in Britain

In the United Kingdom there are no call districts or areas. There are
however variations in the prefix.

In England, the prefix is G or M (I am excluding the 2 as used in
non-CEPT UK licences). When I travel within the UK, my prefix changes
from G to GW, when I am in Wales, as the 'Secondary Locator', W is
added.

These are the Secondary Locators:-
Guernsey - U
Isle of Man - D
Jersey - J
Northern Ireland - I
Scotland - M
Wales - W

England has no Secondary Locator.

Foreign CEPT visitors used to use the prefix G/, but now that new
licences are normally M, replacing the older G; then now the prefix is
M/.

As an example, taken from the Ofcom website:-

"You should use your home callsign after the UK prefix 'M' and
secondary locator if any. Thus a Dutch amateur holding the callsign
PA2MIL would identify in England as M/PA2MIL and an Austrian amateur
holding the callsign OE7PBK would identify in Wales as MW/OE7PBK."

See:-

<http://www.ofcom.org.uk/static/archive/ra/publication/ra_info/ra247.htm>

For completeness, UK ham radio club callsigns can also use an extra
set of Secondary Locators.

I am trying to use WinLink [WLNK-1] with out much luck...

I have tried from three different locations, Wilmington (DE), Falmouth (MA), and North East (MD) to get a WLNK-1 reply from an IGate with out any, BUT I can go to aprs.fi and list my incoming messages AND I should be getting a reply from Winlink (no RF).

I have also checked my path to a wide1-1 jump and it is strong (I get a quick reply to my status messages). I am using a VX8 but have the same problem with a D710a at home in Wilmington.

I would like to run a demo for the Boy Scouts that shows APRS as more then a tracking system - texting and the need for winlink email; texts to my facebook account... I tried a number of times from the scout camp in North East this past weekend - nothing - very depressing.

WHAT AM I DOING WRONG?

Good day,

Might I suggest a alternative to SSID #'s that some have used? Go to and use Tactical Call Signs - i.e. "LEAD", "TAIL", "CKPT7", etc. As long as your call sign is in a comment field someplace, it's obvious who is responsible for the beacon and it's completely legal. You could have dozens of your own beacons in the field and not have to worry about a mere 15 SSID's available or what they mean from year to year.

For instance, I could call a digi "LEWES" rather than "WB3CVN-3", as long as I have "wb3cvn" in a 10-minute btext or other station comment. There's no need for me to do this, although a widespread amateur club with 15+ digi's up would find this a legitimate answer to the concern.

And while it may only be a side effect, any person (ham or not) can look at a computer display from an APRS-tracking computer and tell what unit is where, without a callsign translation table.

And in the case of your three deployable trackers, if an operator is relieved during the event the tracker stays with the duty assignment instead of the event managers (ham or not) having to learn a new call sign for each time that occurs during the day.

Great work, Adam, having a couple of track beacons available for public service work!

Respectfully,

Ted

Not to stir the waters too much, but what's the logic to limiting SSID's to 15? The numbers are just individual characters. Transmitting 15 or 99 would take basically the same amount of time.

It seems to me that there could be logical reasons to expand the list. As a club, we run several digi's and gateways all under a club callsign. The current scheme doesn't lend itself to that.

We often work special events where having unique delineation would be helpful. Take a bicycle ride for instance; checkpoints, sag wagons, medical teams, etc. could all be grouped together giving control operators a much quicker picture of what role the closest vehicle to a problem has.

Digi's could have a range, Digi's with gateways could have a range, D-Star could have a range...?

Just a thought.

The -15 limit is imposed by the AX.25 binary header that goes on all APRS traffic transmitted via AX.25 like almost 100% of the traffic on 2m and 70cm and a good percentage of the traffic on HF. There's only 4 bits in the AX.25 header for the SSID, hence the limit of 0 to 15.

Even the tactical callsigns suggested recently would be limited to 6 characters max with an optional -SSID from -0 (normally suppressed) to -15. It may appear that xxxxxx-nn is 9 characters, but in AX.25 the first 6 are transmitted as bit-shifted ASCII, the dash is not even transmitted, and the nn is converted to binary and stuffed into 4 bits.

On the APRS-IS and via other (non-AX.25) transports (like PSK63 by APRS Messenger on HF 30m) actually treat the field as 9 characters. Objects and Items in the original aprs101.pdf spec are also up to 9 characters. They can do this because they're transmitted in the payload portion of the AX.25 packet, not the header where the restrictions exist.

I have toyed with that idea as well in the past. Problem comes in when a tracker is moved from the lead position of one leg of an event, to the tail of a different leg.

I agree that the Tactical calls are a great way around this, until it failed :) I had the lead tracker device moved from the lead(no longer needed), to a roving bicycle mechanic. I was able to fix it with a quick adjustment in the translations on the UI-View station at NCS, but it became confusing for folks in the field. We all worked around it of course, as we tend to do, but I've found that doing translations in UI-View at the NCS station is easier than trying to reprogram a bunch of trackers. the other problem arises when not all of the trackers in play for the event belong to me, and some are from out of our local club area. I've made the attempt to ask for Tactical call signs to be programed... lets just say that didn't work out so well.

FYI,

Normal NCS set up consists of a computer running Ui-View32, with a mirrored monitor for the public to view, so that even if we are too busy with radio traffic to answer questions, the public, and the race official types can look at a screen and have a basic idea where the front, and tail end of the event is located. I use the Ui-View translation feature to make things easier for those folks to decipher what's going on. It was well received last year at our major event http://www.aidsrideforlife.org/ and we plan to implement it at every chance we get.

As with any plan, it never survives first contact with the enemy. I'll be rearranging my SSID's a bit to conform better, and tacticals are an option I agree, it may be a mix of the two if I know that one station is going to be reassigned in the middle of an event.

73,

Adam

Is there a problem with potential call sign collisions (where the same tactical call sign is used for more than one event at the same time)? It's not too hard to imagine "LEAD" and "TAIL" being used in a number of different places at the same time on a summer weekend, for example.

Using a Ham radio/FCC call sign (or airplane "N" number as is suggested on the RV pilots bulletin board) works to minimize call sign duplication because those are unique.

I realize this suggestion is contrary to the previous assignments, but in an event, using a unique call sign (or call signs if you need more than 16 trackers) for an event and then the SSID as an event-specific assignment (e.g. -1 for lead, -15 for tail) would give you more naming flexibility while minimizing the risk of duplicate call signs.

If reasonable APRS paths are used, there should be no problem via RF.
Your LEAD beacon should not cause a problem with my LEAD beacon as
long as our operations are geographically far enough apart.

For the Hilly Hundred bicycle ride in southern Indiana, we use
HHSAGA-9, HHSAGB-9, HHSAGC-9, etc., for the SAG vehicles. The leading
"HH" provides enough distinction on the two days a year that the event
is held to not cause any conflicts.

Key phrase there being "via RF". If you have mobile Internet feeding any of the display stations, you'll definitely want to do something to ensure uniqueness of your tactical callsigns. Otherwise, your LEAD (or whatever ID collides) might jump back and forth across the country during the event.

7685. Re: [APRS] Using USAPhotoMaps as an Igate

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-10 19:19:38 UTC
From: K9UDX
Topic: 7623 Message: 7685

There was a minor coding error in the program that was inhibiting it
from working as an Igate. As of this morning, Doug posted a new version
on his webiste. So far, it has been working without any problems.
USAPhotoMaps is a great program. It uses either aerial photos or USGS
topo maps (downloaded from Microsoft's terraserver) and will plot the
track of stations received. Now with the Igate function working, it is a
great application.

UI-View wants the Unproto to include APRS as the first argument. So, to get the recommended WIDE1-1,WIDE2-1 you have to enter APRS,WIDE1-1,WIDE2-1.

However, this might be a better question to ask in the UI-View Yahoo group. The base path that you want is WIDE1-1,WIDE2-1. How to set it up on a particular device or in a particular program goes beyond that answer.

Safe Browsing*Diagnostic page for* www.aprs.org

What is the current listing status for www.aprs.org?

Site is listed as suspicious - visiting this web site may harm your computer.

Part of this site was listed for suspicious activity 1 time(s) over the past 90 days.

What happened when Google visited this site?

Of the 1 pages we tested on the site over the past 90 days, 1 page(s) resulted in malicious software being downloaded and installed without user consent. The last time Google visited this site was on 2010-06-02, and the last time suspicious content was found on this site was on 2010-06-02.

Malicious software is hosted on 1 domain(s), including 92.63.111.0/<http://safebrowsing.clients.google.com/safebrowsing/diagnostic?client=Firefox&hl=en-US&site=92.63.111.0/>
.

This site was hosted on 1 network(s) including AS6245 (NETWORK)<http://safebrowsing.clients.google.com/safebrowsing/diagnostic?client=Firefox&hl=en-US&site=AS:6245>
.

Has this site acted as an intermediary resulting in further distribution of malware?

Over the past 90 days, www.aprs.org did not appear to function as an intermediary for the infection of any sites.

Has this site hosted malware?

No, this site has not hosted malicious software over the past 90 days.

How did this happen?

In some cases, third parties can add malicious code to legitimate sites, which would cause us to show the warning message.

From: K9UDX
Topic: 7700 Message: 7701

I am using USAPhotoMaps. It does a good job, is free, and uses the free USGS topo maps and/or aerial photos from MicroSoft's terraserver. You can download it from www.cdmcox.com. It will also act as an Igate which might be valuable for you. If downloading lots of tiles from the terraserver, get a copy of Terrafetcher, also freeware. The downside of USAPhotoMaps might be if the territory you serve is near a boundary of UTM zones.

Some groups (that need map compatibility with the organizations they support) use Terrain Navigator with dmapper for the interface between the radio/TNC and the map. dmapper will also provide automatic posting to National Geographic's Topo! maps. Dmapper is limited to tracking 8 stations. It will not act as an Igate.

For those that follow W7LUS-14 I would like to inform you why you are not seeing me on APRS for the last week or so.

Instead of delivering new RV's I am doing a wind energy project from Casper, WY to Glen Rock, WY through June and July as a Pilot Car. It pays much better, hi! We are moving 161 foot blades where I steer the rear axles of the trailer with a remote control while driving my vehicle.

I have set a house icon in Casper for now and will try to keep it current.

FYI - The high today is 45*F and it might snow tonight up to 2 inches!!! (But I thought it was summer!)

Thanks and 73 de,
Peter

And I always thought the Truck Driver was the one steering the rear wheels. Makes more sense for the Pilot Car to be doing it. Bet it takes a lot of learning between the Truck Driver and the Pilot Car to get it just right.

As for the high temp only being 45*F that's the effects of Global Warming that your feeling. ;-)

7705. Call for Papers & Presentations - 2010 ARRL/TAPR Digital Communications Conference

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-13 20:54:10 UTC
From: Mark Thompson
Topic: 7705 Message: 7705

Note: Presentations at the DCC are encouraged & can be made without submitting a technical paper.

Call for Papers--2010 ARRL/TAPR Digital Communications Conference

Technical papers are solicited for presentation at the 29th Annual ARRL and TAPR Digital Communications Conference to be held September 24-26, 2010 in Portland, Oregon. These papers will also be published in the Conference Proceedings (you do NOT need to attend the conference to have your paper included in the Proceedings). The submission deadline is July 31, 2010. Please send papers to:

Maty Weinberg
ARRL
225 Main St
Newington, CT 06111

or you can make your submission via e-mail to: maty@...

Papers will be published exactly as submitted and authors will retain all rights.

From: Chuck Kimball
Topic: 7629 Message: 7706

One caution to using 'generic' tactical call signs. Your event is
probably not the only one going on that weekend.
Summertime is great for a lot of race events going on at the same time.
I ran into this issue last year, where we didn't have an RF station at
Net Control, and relying on the internet for mapping.
Much confusion when my SAG1 was showing up a couple of hundred miles
away. Since it was programmed into the tracker, and was out on the
course there was no easy fix during the event.
This year I'll either stick with call signs, or make the tactical call
unique by putting a leading letter for the event name i.e. KSAG1.

Chuck

> I have toyed with that idea as well in the past. Problem comes in when a tracker is moved from the lead position of one leg of an event, to the tail of a different leg.
>
>
>
> I agree that the Tactical calls are a great way around this, until it failed :) I had the lead tracker device moved from the lead(no longer needed), to a roving bicycle mechanic. I was able to fix it with a quick adjustment in the translations on the UI-View station at NCS, but it became confusing for folks in the field. We all worked around it of course, as we tend to do, but I've found that doing translations in UI-View at the NCS station is easier than trying to reprogram a bunch of trackers. the other problem arises when not all of the trackers in play for the event belong to me, and some are from out of our local club area. I've made the attempt to ask for Tactical call signs to be programed... lets just say that didn't work out so well.
>
>
>
> FYI,
>
> Normal NCS set up consists of a computer running Ui-View32, with a mirrored monitor for the public to view, so that even if we are too busy with radio traffic to answer questions, the public, and the race official types can look at a screen and have a basic idea where the front, and tail end of the event is located. I use the Ui-View translation feature to make things easier for those folks to decipher what's going on. It was well received last year at our major event http://www.aidsrideforlife.org/ and we plan to implement it at every chance we get.
>

>>
>>
> Good day,
>
> Might I suggest a alternative to SSID #'s that some have used? Go to and use Tactical Call Signs - i.e. "LEAD", "TAIL", "CKPT7", etc. As long as your call sign is in a comment field someplace, it's obvious who is responsible for the beacon and it's completely legal. You could have dozens of your own beacons in the field and not have to worry about a mere 15 SSID's available or what they mean from year to year.
>
> For instance, I could call a digi "LEWES" rather than "WB3CVN-3", as long as I have "wb3cvn" in a 10-minute btext or other station comment. There's no need for me to do this, although a widespread amateur club with 15+ digi's up would find this a legitimate answer to the concern.
>
> And while it may only be a side effect, any person (ham or not) can look at a computer display from an APRS-tracking computer and tell what unit is where, without a callsign translation table.
>

7707. Hamfests! On APRS!

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-15 16:39:36 UTC
From: Robert Bruninga
Topic: 7629 Message: 7707

Hamfests on APRS! Yes!

I was driving up I-81 in VA, and it was midnight. But I noticed on the front panel of the radio, HFEST-13 pop up. I was going right past it in about 30 minutes, and tomorrow was the 13th and I had to stop for the night anyway, so I stopped and next morning got to do a hamfest!

Without APRS, I would have missed that opportunity. And I did not even have to bother the talk-in, because I could see exactly where it was on my GPS and just tell my GPS to go there!

That is why we ask that EVERY hamfest organization (YOU!) to do These things for APRS!

1) Begin posting an HFEST.... object IN ADVANCE showing the hamfest.
2) Use the standard format HFEST-ddx
3) Where "dd" is the day of the month,
4) and "x" is a unique identifier if there are others on your same day
5) Inlcude FFF.FFFMHz as the first 10 bytes of text for the talk-in freq.

THen also

6) Make sure that the TALK in operators have an APRS map in front of them so that they can SEE at least the APRS mobiles. This benefits the mobiles, and lets the operator learn about APRS, and as he finds out how valuable it is to him, he tells others. Then the club learns the value of APRS...

YOU need to make sure YOUR group is doing this.

To see all the hamgest obejects, just do a wildcard search on HFEST* if someone else has the same date, then change your final "x" byte to be unique.

For example map.findu.com/hfest* curently shows about...
Hummh... Exactly one, and it is in Puerto Rico. SURELY THERE ARE MORE HAMFESTS THIS MONTH IN THE USA AND WORLD!

This just shows us how many APRS operators are not doing their job of making APRS useful and practical to other users. Come on guys.. Sheesh...

IF YOU DON'T DO IT, WHO WILL?

If we do not put out USEFUL INFROMATION ON APRS, then there is NOTHING TO DO!

See www.aprs.org/localinfo.html

While I am ranting, is YOUR DIGI in your area putting out the receommended frequency objects for travelers? What about the Echolink or IRLP object.??? Your digi will NEVER do it unless YOU take some initiative and make sure it is getting done or get things going.

Frustrated..
Bob, Wb4APR

7709. New poll for APRS

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-16 12:45:35 UTC
From: APRS@yahoogroups.com
Topic: 630 Message: 7709

Enter your vote today! A new poll has been created for the
APRS group:

Should the following be used as THE standard for APRS SSID's?

-0 (means no -SSID) primary fixed and message capable station (Home)
-1 digis and other fixed stations
-2 digis and other fixed stations
-3 digis and other fixed stations
-4 digis and other fixed stations
-5 WX Stations
-6 Satellite,special events, usuaual tests (Catch All for anything unclassified??)
-7 HT's, walkie talkies or human portable
-8 boats, sailboats OR second vehicles
-9 primary Mobiles of all types
-10 operation via the internet (Igates) (I use this for my UI-View-32 Internet only at work for messaging or whatever)
-11 balloons and aircraft
-12 DTMF, RFID, or other non-APRS sources
-13 Mobile Trackers TX Only ; Other special event stations
-14 Truckers and full time road warriors
-15 Mobile Trackers TX Only

poll will close on July 31's 2010
de
KC2ANT

o Yes
o No
o I have other suggestions

To vote, please visit the following web page:
http://groups.yahoo.com/group/APRS/surveys?id=2978444

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

well, no one said much after Bob posted his thoughful answer....

-0 primary fixed and message capable station
-1 digis and other fixed stations
-2 digis and other fixed stations
-3 digis and other fixed stations
-4 digis and other fixed stations
-5 TBD <= maybe Dstar/Echolink/phones/Ipads etc
-6 Satellite,special events, usuaual tests
-7 HT's, walkie talkies or human portable
-8 boats, sailboats OR second vehicle
-9 primary Mobiles of all types
-10 operation via the internet (Igates)
-11 balloons and aircraft
-12 DTMF, RFID, or other non-APRS sources
-13 TBD <== Weather has been suggested)
-14 Truckers and full time road warriors
-15 HF <== I suggest making this ANYTHING ELSE

These are my personal thoughts

-0 (means no -SSID) primary fixed and message capable station (Home)
-1 digis and other fixed stations
-2 digis and other fixed stations
-3 digis and other fixed stations
-4 digis and other fixed stations
-5 WX Stations
-6 Satellite,special events, usuaual tests (Catch All for anything unclassified??)
-7 HT's, walkie talkies or human portable
-8 boats, sailboats OR second vehicles
-9 primary Mobiles of all types
-10 operation via the internet (Igates) (I use this for my UI-View-32 Internet only at work for messaging or whatever)
-11 balloons and aircraft
-12 DTMF, RFID, or other non-APRS sources
-13 Mobile Trackers TX Only ; Other special event stations

-14 Truckers and full time road warriors
-15 Mobile Trackers TX Only

I'll go throw a poll up on the yahoo group after I send this for my suggestions listed above.

From: Robert Bruninga
Topic: 630 Message: 7711

Actually, the list in the poll, was not the latest version that
is on the aprs.org site. Here is that list of the APRS
conventions for SSID's:

-0 Your primary station usually fixed and message capable
-1 generic additional station, digi, mobile, wx, etc
-2 generic additional station, digi, mobile, wx, etc
-3 generic additional station, digi, mobile, wx, etc
-4 generic additional station, digi, mobile, wx, etc
-5 Other network sources (Dstar, Iphones, Blackberry's etc)
-6 Special activity, Satellite ops, camping or 6 meters, etc
-7 walkie talkies, HT's or other human portable
-8 boats, sailboats, RV's or second main mobile
-9 Primary Mobile (usually message capable)
-10 internet, Igates, echolink, winlink, AVRS, APRN, etc
-11 balloons, aircraft, spacecraft, etc
-12 APRStt, DTMF, RFID, devices, one-way trackers*, etc
-13 Weather stations
-14 Truckers or generally full time drivers
-15 generic additional station, digi, mobile, wx, etc

I hope everyone will accommodate this list on their sites.

I have other suggestions
in EU we use this

SSID -0 (no SSID) should be used for all fixed stations (home-qth)
SSID -1 should be used for all sorts of gateways (IGATE, Sat-Gate,
HF-Gate and so on)
SSID -2 should be used for APRS-WIDE-Digipeater (which are
digipeaters with aliases of (WIDEn-n)
SSID -3 should be used for APRS-FILL-IN-digipeaters (aliases of WIDE1-1
only)
SSID -4 2nd fixed stations (2nd Home-qth)
SSID -5 should be used for WX stations
SSID -6 APRS via MOBILEPHONES
SSID -7 should be used for special mobile stations (truck, bicycle,
motorbike, Jeep, bus, RCV ect., NOT for normal cars)
SSID -8 should be used for fixed, portable stations and Boats
SSID -9 should be used for normal cars
SSID -10 should be used for Sat-stations (using APRS via satellite)
SSID -11 should be used for TCPIP stations
SSID -12 Balloon, Aircraft
SSID -13 unassigned
SSID -14 truck 18 Wheels
SSID -15 SW

7714. RE: [APRS] Re: Standards for SSID's

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-16 14:21:41 UTC
From: Stephen M. Shearer
Topic: 7629 Message: 7714

OK, I have a few questions about SSID's before I change my vote...

1. I came from packet (20+ years ago) and it didn't matter what the SSID was - you just need one different then any other you may have.
2. "standards" are nice - not everyone is going to follow. I know I didn't as I was figuring out how my APRS radio(s) worked.
3. Don't the icons (symbol) you choose say more about the station you are running? If you follow that "standard".
4. When I am "out in the field" I am not sure I will remember the difference between SSID-10 and SSID-11.
5. I move my APRS radio from home, to car, to camp, to ... - it is a pain to make changes to the SSID and icons every time I change locations.

I like either "standard".
Maybe the vote should be on what SSID-0 should be, what SSID-1 should be, and so on?
Does it matter? Not everyone is going to rush out and change their SSID.
We have weather stations in our area with a SSID of -2, I doubt they will make changes (yes they are also "other fixed station").

Inform me - 73, Steve WB3LGC

Subject: RE: [APRS] Re: Standards for SSID's

well, no one said much after Bob posted his thoughful answer....

-0 primary fixed and message capable station
-1 digis and other fixed stations
-2 digis and other fixed stations
-3 digis and other fixed stations
-4 digis and other fixed stations
-5 TBD <= maybe Dstar/Echolink/phones/Ipads etc
-6 Satellite,special events, usuaual tests
-7 HT's, walkie talkies or human portable
-8 boats, sailboats OR second vehicle
-9 primary Mobiles of all types
-10 operation via the internet (Igates)
-11 balloons and aircraft
-12 DTMF, RFID, or other non-APRS sources
-13 TBD <== Weather has been suggested)
-14 Truckers and full time road warriors

-15 HF <== I suggest making this ANYTHING ELSE

These are my personal thoughts

-0 (means no -SSID) primary fixed and message capable station (Home)
-1 digis and other fixed stations
-2 digis and other fixed stations
-3 digis and other fixed stations
-4 digis and other fixed stations
-5 WX Stations
-6 Satellite,special events, usuaual tests (Catch All for anything unclassified??)
-7 HT's, walkie talkies or human portable
-8 boats, sailboats OR second vehicles
-9 primary Mobiles of all types
-10 operation via the internet (Igates) (I use this for my UI-View-32 Internet only at work for messaging or whatever)
-11 balloons and aircraft
-12 DTMF, RFID, or other non-APRS sources
-13 Mobile Trackers TX Only ; Other special event stations

-14 Truckers and full time road warriors
-15 Mobile Trackers TX Only

I'll go throw a poll up on the yahoo group after I send this for my suggestions listed above.

Subject: [APRS] Re: Standards for SSID's

Ok. Since I opened this whole can of worms. Are we in agreement on a Standard? Or are we still divided? Maybe we can put a few ideas to a poll here in and see what we come up with. I would put Aprs.org and Aprs.net in the poll as they are pretty much in agreement. Does someone want to start a poll and go from there?

From: Adam Mahnke
Topic: 7629 Message: 7715

When I first got into APRS my stuff was all over the place.. in fact, I still have a car as a -2 (oops) we all buy radio's, set them up, get on the air, and then read the manual about them, and then start searching the interweb for other stuff. at least that's how I do it.

I agree that the symbols do tell a lot about what a station is, and is doing, however when operating from the radio environment not all symbols are visible as anything other than the table characters. There's a lot more of those than there are SSID's. If I can glance at a station on my mobile screen as I'm driving down the road and have a general idea of what kind of station it is based on remembering 15 #'s as opposed to all those symbols, that seems easier to me, but then again most of my APRS operations is as a mobile station.

it's a hobby, truth be told we'll all do whatever we want anyway, but for some folks that get to the searching the interweb stage, if there is some kind of standardization out there, it might be less confusing.

7716. Denver Metro APRS

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-16 15:46:50 UTC
From: beggsrl
Topic: 7716 Message: 7716

Greetings

I do not know where it started but here in the Denver Metro area when I got into APRS I was told to use 7 SSID for my Kenwood D700 because it had messaging capabilities. My truck currently even has N0EB-7 as my License plate, and My other truck is just N0EB because it has no APRS capabilities unless I take my portable along. Now my IGate has been N0EB-1 ever since it went on the air in 2003, so being told to change to 9 for my mobile and -10 for my IGate is just not going to happen. Unless some one wants to pay to have new plates made for my truck. As for the IGates most of the ones here in Denver do not even use SSID they are just identified with there call letters and now some are even using alias's such as THOR for a digi on mt Thorodin. So all the discussion and voting may give some a warm and fuzzy but the reality of SSID truly is going to be more of a regional thing. If everyone around you goes with an alias and put there call sign in the station data, so be it. I am not going to say this is right or wrong but just the way it is.

Topic: 7717 Message: 7717

After just receiving my D700, I am confused about the right settings. I would like someone to contact me and help me get these settings right (maybe off-list). I want to track, use Voice Alert, and, when I'm parked, maybe switch to a fill-in digipeater. Just don't want to look like a LID on APRS.

Thanks in advance for your help. I know this is the greatest place for the kind of help that I need.

I would like to see one for Motorcoaches or RVs in general. As we travel, we look for other Hams who are traveling in their RVs. My XYL Vicki K5VLK and I are full time RVers and often try to park with other Hams. Just listing them as Mobiles does tell us whether the Mobile is also a RVer.

I'll second that motion for the motorcycle.

At the very least one for each of the following:

Primary vehicle
Secondary vehicle
Plane
Motorcyle
Bicycle
RV

And yes I have and use all of them.

we, and others, use -13 for RVs.

73,
rich, n9dko
www.bananaboatbytes.com
I have kleptomania. When it gets bad I take something for it.

I would like to see one for Motorcoaches or RVs in general. As we travel, we look for other Hams who are traveling in their RVs. My XYL Vicki K5VLK and I are full time RVers and often try to park with other Hams. Just listing them as Mobiles does tell us whether the Mobile is also a RVer.

And I am sure there are suggestions for separate SSIDs for much more
then 16 different types of stations, and we only have 16 possible
SSIDs.
Symbols. Symbols. Sybols. Use those.

7728. Post your local HAMFEST object!

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-17 02:03:19 UTC
From: Bob Bruninga
Topic: 7728 Message: 7728

There are 13 HAMFESTS THIS Weekend!
NONE are showing up on APRS!
If YOU don't post these objects on APRS RF who will???

See the ARRL Hamfest Calendar:
http://www.arrl.org/hamfests-and-conventions-calendar

Here is the list for Saturday the 19th

Santa Maria, CA
Newington, CT
Titusville, FL
Midland, MI
Kinston, NC
Piscataway, NJ
Milford, OH
Cleona, PA
Columbia, SC
Windsor, VT

and Sunday the 20th:

Wheaton, IL
Cambridge, MA
Monroe, MI
Erie, PA

I prepared a web page to tell eveyrone how to make such an object and how to use APRS in support of the Hamfest and Talkin:

www.aprs.org/hamfest.html

To see if anyone has posted your hamfest just follow this link:

http://map.findu.com/HFEST*

RIght now, there is only one, and it is in Puerto RICO!

Bob, WB4APR

Bob's suggestion after much earlier discussion was for RVs to share the -8 SSID with boats. I'll admit that my first reaction was "wait a minute! that's MY SSID" but on reflection there is a great deal of commonality between RVs and cruising boats. There is also little chance of confusion when positions are plotted on a map. *grin*

Further, where cruising grounds do abut there is opportunity for some interesting discussion. If I saw you within a reasonable distance I'd very likely give you a call and see if you there was somewhere to pick you up in our dinghy and have you out for a drink. Perhaps you would invite us back to grill something.

Hi Dave,

Thanks for clearing this up. I will put the word out to the Motorcoach Community. I am a member of several RV clubs with sub-clubs for Ham Radio Operators.

We all have been looking for a way to identify other RVers as we travel.

We (XYL Vicki K5VLK) have been full timers since 1999 and were some of the first to purchase APRS equipment.

With declining health, it is great to have our six kids and ten grandkids follow us as we travel.

Never had much luck driving a 40' coach and operating HF at the same time, and VHF/UHF was a hit and miss situation, until APRS. Now, if I see a contact on APRS, I can work him/her. Awesome!

How would I put an object out on a tt4, D710, or VX8?

I am not sure I have a hamfest to spot, but scouting events might be
something I would want to do next month (Boy Scout National Jamboree)...
Mainly with a VX8...

I did see Bob's info on using a D710 on traffic spot's. It would be nice to
be able to do this without having to change the callsign. I may also have a
rig running ui-view - can it place objects, without changing the callsign?
I don't want to change the callsign(s), because the rig(s) will be running
as a digi - except the VX8.

Topic: 7629 Message: 7734

I am thinking an SSID for a Segway makes sense as well. So it falls in the 1-4 group clearly as a mobile or etc station. Of course if it is a D7 or VX8 then maybe -8 is better.

Here is the list:
-0 Your primary station usually fixed and message capable
-1 generic additional station, digi, mobile, wx, etc
-2 generic additional station, digi, mobile, wx, etc
-3 generic additional station, digi, mobile, wx, etc
-4 generic additional station, digi, mobile, wx, etc

One way to free up SSIDs for other uses is a better naming scheme of the principle digi. And it does exist. If a digi is up in a obvious spot, a tactical call sign would seem more reasonable. Look at CRYSTL, YAKIMA, MISION, TOLGAT which are all in the Pacific Northwest. The name tells more about the placement than a call sign. Look through the area and see all of them. Look at Colorado as well in the SW corner. You will find ALMOSA, DURNGO, TENDER, CHAIR, INDYPS, WATRDG and UBUTTE.

So how does this really work, find your station and label in WTOWN or maybe ETOWN. Those two examples indicate a digi in the WEST or EAST side of some town.

Personally I would rather see a location descriptor rather than some ambiguous call sign that means nothing to me.

Best regards,
Fred, UNCAN, N7FMH-9

> How would I put an object out on a tt4, D710, or VX8?

There is nothing different between an object and a station.
To put out an "object" with an APRS radio, all you are doing is
changing some parameters, and transmitting the object as if it
was you. Change these:

- MYCALL - change to the name of the object
- Symbol - change to the appropriate symbol
- Comment or Status - Change as appropriate
- position - (if different from present position)

Transmit it a few times. Verify that it was digipeated a few
times, and then change everything back to your normal settings.

Of course, the APRS-IS will capture this if an Igate hears it,
but no one else on RF will see it unless you keep transmitting
it while they are in range. Those that come after you have
reverted back to your own call, will not see it.

The D700 and D710 are best, beacsue you can save 5 different
callsigns, symbosl, and status and save them in a PM. And then
switch back and forth to keep the object refresehd for new
commers.

NOTE, the name must fit in the standard 6 character callsign
field when using this technique.

From: kd5pck
Topic: 7738 Message: 7738

Hello all,
I am looking to put into service a Kenwood TH-D7A(G)that's just been collecting dust. I want to create an all in one unit that will be self-contained to be used as a tracker only. I plan to use this for a bicycle ride that my club participates in each fall. I need a GPS receiver that will interface with the radio and grab the coordinates and beacon them out (hockey puck?). Anyone using a setup similar to this? What are you using for a GPS. I would prefer a plug and play solution if one exists.
Thanks for you time.

Scott

Scott,

Check out the website www dot byonics dot com for a GPS2 and the interface that just plugs in. This does require a power source for the GPS, but these units have provided the most accurate locations in all my uses. I own several, and use them frequently. Not just something I "ran across".

Thanks and God Bless

My "all-in-one" wasn't that compact and was pretty ugly. I used a TinyTrak 4, Yaesu VX-1R, Byonics hockey puck GPS, and a small battery pack for the TT4/GPS. TNC<->Radio cable was from Byonics.

The radio was taped along the inside edge of a gallon sized zip-lock bag so I could keep the antenna oriented properly and everything else was just rubber banded together and tossed in the bag. The GPS lead came out so I could stick the unit on a boat.

The BR-355 GPS ($35 or so):

http://www.buygpsnow.com/globalsat-br355-globalsat-355-water-proof-serial-gps-receiver-sirf-star-iii-br355-v3-1-1-432.aspx

(That link was down when I just tried it, but search for BR-355 and you
should find it. I just had one of these plugged into the side of a D710
using a D7's cable and it work famously. You do have to figure out
where to get 5v to feed it though.

My XYL and myself are also both hams and RVers, but we normally use my callsign and not hers for APRS in the RV. Using hers if one of both of use also operate away from the RV.

But with only 16 SSIDs it's not possible to have one for every use, so the icon is preferred.

But these are American biased and we are Gs. We wont use 'jeep' (note the lowercase j) as here to call a Land Rover a jeep is considered an insult! Our MH (motorhome) is on a Land Rover, but we frequently use the American RV to describe our vehicle.

Rover shows as a dog and we don't have a dog!

Being able to identify other RVers is to us a most useful feature of using APRS. We would like to use it with Raynet, but our local group does not use it.

Thanks Noel

I am also looking for an APRS solution, something that is all together, not a battery hog and does all the functions available to use thru APRS. I already have two non-aprs radios, otherwise I probably would have bought a Kenwood with aprs built in.

73 Tom kf5feo

Scott,

Check out the website www dot byonics dot com for a GPS2 and the interface that just plugs in. This does require a power source for the GPS, but these units have provided the most accurate locations in all my uses. I own several, and use them frequently. Not just something I "ran across".

Thanks and God Bless

Check out the MT-AIO from Byonics. I also have one of these and it runs about 4 days on rechargeable batteries or about 8 days on alkaline. Tx only, though.

Thanks and God Bless

Be aware that the symbols are shown as defined on the recipients'
computers (for ui-view in the symbols files), and that the symbols
themselves are not sent.

Noel,
Thanks for the information. This looks like the solution I was looking for. Plug and play is the best for me since I don't have the necessary tools/equipment to homebrew. I may be placing an order with them over the weekend. They should give you some sort of commission!

Scott

Bob:

You should write a brief article for QST and other online blogs. Get the word out.

Btw - there is no hamfest in Columbia,sc this weekend.

Subject: [APRS] Post your local HAMFEST object!

There are 13 HAMFESTS THIS Weekend!
NONE are showing up on APRS!
If YOU don't post these objects on APRS RF who will???

See the ARRL Hamfest Calendar:
http://www.arrl.org/hamfests-and-conventions-calendar

Here is the list for Saturday the 19th

Santa Maria, CA
Newington, CT
Titusville, FL
Midland, MI
Kinston, NC
Piscataway, NJ
Milford, OH
Cleona, PA

Columbia, SC
Windsor, VT

and Sunday the 20th:

Wheaton, IL
Cambridge, MA
Monroe, MI
Erie, PA

I prepared a web page to tell eveyrone how to make such an object and how to use APRS in support of the Hamfest and Talkin:

www.aprs.org/hamfest.html

To see if anyone has posted your hamfest just follow this link:

http://map.findu.com/HFEST*

RIght now, there is only one, and it is in Puerto RICO!

Bob, WB4APR

How would I put an object out on a tt4, D710, or VX8?

I am not sure I have a hamfest to spot, but scouting events might be
something I would want to do next month (Boy Scout National Jamboree)...
Mainly with a VX8...

I did see Bob's info on using a D710 on traffic spot's. It would be nice to
be able to do this without having to change the callsign. I may also have a
rig running ui-view - can it place objects, without changing the callsign?
I don't want to change the callsign(s), because the rig(s) will be running
as a digi - except the VX8.

UI-View will do objects Open it up, hit F5 and read the help file :)

Also read http://aprs.org/localinfo.html

my home station does it's self, and several repeater objects with no issues.

> How would I put an object out on a tt4, D710, or VX8?

There is nothing different between an object and a station.
To put out an "object" with an APRS radio, all you are doing is
changing some parameters, and transmitting the object as if it
was you. Change these:

- MYCALL - change to the name of the object
- Symbol - change to the appropriate symbol
- Comment or Status - Change as appropriate
- position - (if different from present position)

Transmit it a few times. Verify that it was digipeated a few
times, and then change everything back to your normal settings.

Of course, the APRS-IS will capture this if an Igate hears it,
but no one else on RF will see it unless you keep transmitting
it while they are in range. Those that come after you have
reverted back to your own call, will not see it.

The D700 and D710 are best, beacsue you can save 5 different
callsigns, symbosl, and status and save them in a PM. And then
switch back and forth to keep the object refresehd for new
commers.

NOTE, the name must fit in the standard 6 character callsign
field when using this technique.

Bob, Wb4APR

Bob's suggestion after much earlier discussion was for RVs to share the -8 SSID with boats. I'll admit that my first reaction was "wait a minute! that's MY SSID" but on reflection there is a great deal of commonality between RVs and cruising boats. There is also little chance of confusion when positions are plotted on a map. *grin*

Further, where cruising grounds do abut there is opportunity for some interesting discussion. If I saw you within a reasonable distance I'd very likely give you a call and see if you there was somewhere to pick you up in our dinghy and have you out for a drink. Perhaps you would invite us back to grill something.

Hi Dave,

Thanks for clearing this up. I will put the word out to the Motorcoach Community. I am a member of several RV clubs with sub-clubs for Ham Radio Operators.

We all have been looking for a way to identify other RVers as we travel.

We (XYL Vicki K5VLK) have been full timers since 1999 and were some of the first to purchase APRS equipment.

With declining health, it is great to have our six kids and ten grandkids follow us as we travel.

Never had much luck driving a 40' coach and operating HF at the same time, and VHF/UHF was a hit and miss situation, until APRS. Now, if I see a contact on APRS, I can work him/her. Awesome!

73,
Rex

I am thinking an SSID for a Segway makes sense as well. So it falls in the 1-4 group clearly as a mobile or etc station. Of course if it is a D7 or VX8 then maybe -8 is better.

Here is the list:
-0 Your primary station usually fixed and message capable
-1 generic additional station, digi, mobile, wx, etc
-2 generic additional station, digi, mobile, wx, etc
-3 generic additional station, digi, mobile, wx, etc
-4 generic additional station, digi, mobile, wx, etc

One way to free up SSIDs for other uses is a better naming scheme of the principle digi. And it does exist. If a digi is up in a obvious spot, a tactical call sign would seem more reasonable. Look at CRYSTL, YAKIMA, MISION, TOLGAT which are all in the Pacific Northwest. The name tells more about the placement than a call sign. Look through the area and see all of them. Look at Colorado as well in the SW corner. You will find ALMOSA, DURNGO, TENDER, CHAIR, INDYPS, WATRDG and UBUTTE.

So how does this really work, find your station and label in WTOWN or maybe ETOWN. Those two examples indicate a digi in the WEST or EAST side of some town.

Personally I would rather see a location descriptor rather than some ambiguous call sign that means nothing to me.

Best regards,
Fred, UNCAN, N7FMH-9

My XYL and myself are also both hams and RVers, but we normally use my
callsign and not hers for APRS in the RV. Using hers if one of both
of use also operate away from the RV.

But with only 16 SSIDs it's not possible to have one for every use, so
the icon is preferred.

But these are American biased and we are Gs. We wont use 'jeep' (note
the lowercase j) as here to call a Land Rover a jeep is considered an
insult! Our MH (motorhome) is on a Land Rover, but we frequently use
the American RV to describe our vehicle.

Rover shows as a dog and we don't have a dog!

Being able to identify other RVers is to us a most useful feature of
using APRS. We would like to use it with Raynet, but our local group
does not use it.

Reg

Be aware that the symbols are shown as defined on the recipients'
computers (for ui-view in the symbols files), and that the symbols
themselves are not sent.

Hello all,
I am looking to put into service a Kenwood TH-D7A(G)that's just been collecting dust. I want to create an all in one unit that will be self-contained to be used as a tracker only. I plan to use this for a bicycle ride that my club participates in each fall. I need a GPS receiver that will interface with the radio and grab the coordinates and beacon them out (hockey puck?). Anyone using a setup similar to this? What are you using for a GPS. I would prefer a plug and play solution if one exists.

Thanks for you time.

Scott

Scott,

Check out the website www dot byonics dot com for a GPS2 and the
interface that just plugs in. This does require a power source for the
GPS, but these units have provided the most accurate locations in all my
uses. I own several, and use them frequently. Not just something I
"ran across".

Thanks and God Bless

My "all-in-one" wasn't that compact and was pretty ugly. I used a
TinyTrak 4, Yaesu VX-1R, Byonics hockey puck GPS, and a small battery
pack for the TT4/GPS. TNC<->Radio cable was from Byonics.

The radio was taped along the inside edge of a gallon sized zip-lock bag
so I could keep the antenna oriented properly and everything else was
just rubber banded together and tossed in the bag. The GPS lead came out
so I could stick the unit on a boat.

73,

Tim N9PUZ

The BR-355 GPS ($35 or so):

http://www.buygpsnow.com/globalsat-br355-globalsat-355-water-proof-serial-gps-receiver-sir
f-star-iii-br355-v3-1-1-432.aspx

(That link was down when I just tried it, but search for BR-355 and you
should find it. I just had one of these plugged into the side of a D710
using a D7's cable and it work famously. You do have to figure out
where to get 5v to feed it though.

Wiring diagram:

http://www.flickr.com/photos/90108848@N00/sets/72157621651452727/

Thanks Noel

I am also looking for an APRS solution, something that is all together, not a battery hog and does all the functions available to use thru APRS. I already have two non-aprs radios, otherwise I probably would have bought a Kenwood with aprs built in.

73 Tom kf5feo

Scott,

Check out the website www dot byonics dot com for a GPS2 and the interface that just plugs in. This does require a power source for the GPS, but these units have provided the most accurate locations in all my uses. I own several, and use them frequently. Not just something I "ran across".

Thanks and God Bless

Check out the MT-AIO from Byonics. I also have one of these and it runs
about 4 days on rechargeable batteries or about 8 days on alkaline. Tx
only, though.

Thanks and God Bless

7754. APRS Strings -- where is Lat-Long data?

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-20 04:51:00 UTC
From: bill-cahill@att.net
Topic: 7754 Message: 7754

In a move that ought to make Bob happy, after two years I switched from a "dumb tracker" to a 'D710 today. Works great and having fun with it but I noticed that my strings look a lot different than they used to with the tracker. I used to be able to look at the raw strings on aprs.fi and see my latitude and longitude. Now they don't show that, they look more like:
2010-06-20 04:18:54 UTC: AD8BC-9>SRTX7T,K5FTW-5,WB5AOH-12*,qAR,WB5AOH-14:`}a>l"<k/]"5`}=

Is the latitude and longitude encoded in the SRTX7T part of the string? Since I have been stationary, the last few transmissions haven't changed in this regard but when I was mobile they did.

Just curious and trying to learn!

Thanks,

-- Bill AD8BC

>

These are "MIC-E" encoded packets. The destination address and info field encode the posit together. The whole thing is described in chapter 10 of the APRS spec.

HTH,
T.

7756. What am I missing in the assignment of 0-15 SSIDs?

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-24 07:37:19 UTC
From: George Helser
Topic: 7756 Message: 7756

I have three vehicle APRS beacons, plus a Byonics AIO, a D7A, a D700 base station, an I-phone and four laptops running UI-View (up to three PCs running at one time). I do not see a sensible way of using them all with only two or three SSID -numbers/slots. I can see why there is so much confusion and conflicts by trying to cram a hundred different beacon categories into not enough slots. It does not fit! If I had three Jeeps, I would NOT make them all -9s. Everyone would be confused where I was driving one Jeep if another one was stolen and on the way to Mexico. My beacons would be jumping back and forth on a map between Scottsdale and Mexico! The Phoenix area has about 11 digipeaters put up on the same club call sign. How would it work of they all shared one two or three SSIDs?

Someone may have a reason for cramming multiple devices into one SSID slot/number but I do not. I use UI-View, Find-U, APRS-FI, D700 & D7A to track beacons. All these tools allow me to see an APRS symbol. I think UI-View supports about 200 symbols. The SYMBOL-ID, not a 0-15 AMBIGUOUS dash-number tells me what kind of beacon or which digipeater I am monitoring.

I assign each APRS beacon I have a unique SSID. That is not a problem because I have less than 16 beacons. Observers can get a clue as to the nature of my device by its symbol...Jeep, car, truck, boat, RV, jogger, another jogger, etc.

I am sorry if using a unique SSID for each of my APRS beacons causes confusion to someone out there but using the same SSID for multiple beacons does not work for the APRS tools I use.

Regards,
George W7SAZ

7757. Tracking a mobile via ISS

Yahoo group: APRS (2007 — 2010)
Date: 2010-06-24 12:31:15 UTC
From: Barry Kanne
Topic: 7757 Message: 7757

I will be driving to Montana and Wyoming in mid-July through national park areas that are not covered by 144.39 iGate stations. I would like to set up a TT3 tracker on 145.825 to beacon my travels and see how well that works.

Questions:

1. Are there any issues prohibiting my doing this?

2. Has anyone successfully used the TT3-AIO model (5 watts) to communicate via the ISS?

3. What TT3 settings are suggested to accomplish this?

Thanks for any guidance.

Barry (W4TGA)

Check the www.ariss.net web page, and ISS has not been heard in
months.

The absolute last thing we want on the uplink of the ISS or any APRS satellite are unattended beacons runing 24/7/365. But on the other hand, the digipeater is there to relay active participants and experiments, and your trip sounds like a special event and you are at the station.

But 5 watts is barely going to have a chance, but you can get in if you do not get stepped on. I'd use a 1/4 wave ground plane on the roof so that you get a few dB gain going UP. Do not use a 5/8's or any other mobile gain antenna where all the energy is on the horizon.

But don't just use your APRS via ISS. All the rest of the time, set your beacon to a 1 minute rate (Via WIDE1-1) and operate on 144.39 with CTCSS 100 and with a speaker on the radio. This is running Voice Alert and is a great way to run into other APRS Mobiels. You will hear any when they get in simplex range of you. See www.aprs.org/VoiceAlert3.html If you are going to turn the volume down, then do NOT TX with PL 100.

During the ISS passes, just tune over to 145.825 for the duration and see if you get in.

You can tell when ISS is going over by just spending your first day monitoring 145.825 all day. Once you hear the ISS, then you can assume you will hear it again 91 minutes later for up to 7 passes per day! Note the time.

The next day of your trip, the times will then be 23 minutes later. See the web page: http://aprs.org/MobileLEOtracking.html you don't need any tracking computer or anythng, Just a note each day of when you heard ISS, and then you can mentally predict the rest of the passes each day.

But the important thing for making contact with other hams is to set up your "tracker" as a 2 way device with a RECEIVER that is listening with CTCSS 100 and then you will be able to be reached by other hams nearby (who are also out in the wilderness and not hitting any digis either)...

Bob, WB4APR

"But 5 watts is barely going to have a chance,"

Not so Bob, I hit the ARISS with 1/4watt and a 5/8 wave Larsen whip INSIDE my house. I was using a Kenwood D7G on batteries on low power. I had a 2 high passes back to back (late at night). I beconed every 30 seconds through the night.

I was thinking about what it might take to beacon regularly from a sailboat at sea. How little equipment, power, type of antenna, etc that I could get away with.

Of course I wouldn't expect this regularly, but it was neat to wake up to see that my position made it to the internet.

Besides, cool bragging about it!

I too have made it to the space station with a 5 Watt Handheld from the Big Sky Montana area. In fact some of the local hams were scratching their head when my call sign showed up in location that had no digi's. Then they looked at the data and saw that it went through ISS. In fact my longest data message was from Big Sky, MT to Mexico City through the space station when it was low on the horizon with handheld and a rubber ducky antenna.

Rahn

If you have HF capability you might think of using that instead of ISS. I just completed a 2200 mile road trip and was Igated in places where there was no vhf coverage for miles. I used a TT4 pluged in the mic jack of a 706 MKIIG connected to a Little Tarheel antenna.

73 and good luck

7769. Micro-Trak AIO-IV

Yahoo group: APRS (2007 — 2010)
Date: 2010-07-03 14:49:55 UTC
From: vhsproducts
Topic: 7769 Message: 7769

I have just uploaded a photo album for the MT AIO-IV. (http://groups.yahoo.com/group/MicroTrak/photos/album/1014529163/pic/list)

This is the Transceiver based on the Byonics TT4 controller, and has a 10 Watt transceiver, battery, GPS, etc, "Ready-to-go" (not in the actual sense quite yet though I am afraid) In addition to being a tracker, like the TT4, it can act as a stand-alone digipeater. It has a Bluetooth connection on its primary serial port for programming, firmware uploads, and of course, for use with a PDA or computer for mapping and/or messaging. The GPS code will have an advanced version of the feature we use in the transmitter-only AIO, but will take steps to verify that the position fix is the most accurate position the GPS can provide before allowing a transmission. Turning on the GPS and waiting for a locked signal allows us to run a regular MT-AIO for about 8 days with 2 minute check-ins,with a pack of AA batteries. Although I don't expect the transceiver to run that long (The receiver is always on) I do expect to have excellent power efficiency.

One thing we are looking at is to allow the unit (when operating as a tracker) to first send a low power, 1/2 Watt data burst, and listen to see if it was digipeated. If not, the unit will try again at high power, 10 Watts. This is still experimental, and I am not sure how it will apply when used as a digipeater. I am also not sure if the production model will use the clear-lid case (I just like to see the LED's!) Thoughts?

I have no idea on cost yet, and we hope to have a version ready to test with Lynn Deffenbaughs' APRSIS32 program soon. (If you have not seen it I suggest you take a look at it-its brilliant!)

The initial units are set up to run on battery power, but you could operate it from external power with an regulated power supply, our little power supply board might be suitable, I will have to test and verify. This will be great for airplanes, since the AIO-IV can be mounted out of site, but addressed with a Bluetooth enabled device for messaging and mapping if desired.

For SAR use, the advantage of having each tracker operate as a store and forward station for all the other units should be attractive. In Northern California, where I live the terrain is not always optimal for hitting digis! Lots of deep canyons.....

Hello all, I figured this would be a good place to get good info on the APRS stuff.

I'm looking to get started in APRS with my home station, maybe even a APRS wx station.

I would like some suggestions on what I need to get rolling.

I'm new to all this, I'm sure there's a lot to learn.
I saw APRS demo during FD and sure looked interesting.

Thanks to those who responded off line.

Just to clarify, I have an origional KPC-9612 with version 8.2b however having set-up trouble. The digi appears to be working however the object does not show on the map. I've gone through the set-up but obviously missing something so wondering if anyone has a loader text file that may shed some light on where I'm going wrong.

73- Ken

Yes. The capability you're looking for is called IGATE, for
Internet Gateway.

Most flavors of APRS programs have it. UI-View has it, Xastir has
it.

Topic: 790 Message: 7780

Are you wanting to put up an IGate? That's a configuration the receives APRS messages from RF and injects them into APRS-IS (the Internet side) for visibility world-wide (including via aprs.fi which is simply a database of APRS-IS traffic with a very fancy viewer). A properly configured IGate will also take selected messages from the -IS and put them back over RF for "local" stations, typically automatically. For this last function, you need to be aware of your local RF licensing requirements for "unattended" operation.

Hi Brian,
I would recomend UI-View for your APRS program. I have also had good luck with the LaCrosse weather stations. Make sure the weather station you purchase is compatible with UI-View. I am not sure what ones are but I am sure someone on here does. What computer, TNC, Radio do you have if you have them? I also use AGW a very nice software. I also use it for the (No TNC) soundcard feature.

Thanks Allan. I have 2 KPC-3's and 2 KAM's in digi service but there is something different, perhaps in the LT string, with the 9612.

Ken,
I have two 9612's. I set them up the same as KPC-3's.
I looked at your raw and found errors in your position string, and beacon.

Looks like you got it straightened out:-) I see it is working good now, and forwarding traffic.
Bravo,
73's
Alan

Thanks. Done with OpenOffice Calc.

Perhaps crank up the default size in your web browser?

Curt,

I have tried a couple of times to send you an email but it wouldn't go through.

USAPhotoMaps has been updated as of late last month. Several bugs in the APRS code (including Igate) have been fixed.

Yes, it seems to be working now. Thanks.

Started a second 9612 but this one is a plus with V8.1 Assume it requires a firmware upgrade for digi service?

with internet explorer...click on VIEW and then TEXT SIZE. i presume the other web browsers have a similar method. the smaller screen size will certainly make it more difficult to read some web pages. increasing the text size will help with that.

As noted by others already you can hold the CTRL key and hit '+' or '-' to zoom in or out. Also in most browsers in either the lower right or left hand corner is the "scale" and a '+' and '-' button. Also at the top in the "View" menu item you can either zoom the page or change the text size.

7798. Final Call for Papers & Speakers at 2010 ARRL/TAPR Digital Communications Conference (DCC)

Yahoo group: APRS (2007 — 2010)
Date: 2010-07-09 18:58:17 UTC
From: Mark Thompson
Topic: 7798 Message: 7798

Speakers are encouraged to make presentations at the Digital Communications Conference (DCC).

Presentations can be made at the DCC even if you don't submit a technical paper.

Speakers may be accepted after Call for Papers has closed, but TAPR needs to be aware
in advance of your interest to speak at the DCC.

Final Call for Papers--2010 ARRL/TAPR Digital Communications Conference
Posted by: "Ford, Steve, WB8IMY" sford@... wb8imy
Date: Thu Jul 1, 2010 1:29 pm ((PDT))

Technical papers are solicited for presentation at the 29th Annual ARRL and TAPR Digital Communications Conference to be held September 24-26, 2010 near Portland, Oregon. These papers will also be published in the Conference Proceedings (you do NOT need to attend the conference to have your paper included in the Proceedings). The submission deadline is July 31, 2010. Please send papers to:

Maty Weinberg
ARRL
225 Main St
Newington, CT 06111

or you can make your submission via e-mail to: maty@...

Papers will be published exactly as submitted and authors will retain all rights.

7800. What to use for APRS on HF

Yahoo group: APRS (2007 — 2010)
Date: 2010-07-09 22:20:58 UTC
From: g4ilo
Topic: 7800 Message: 7800

I have recently been running an APRS gateway on 30m HF. I have been using my Elecraft K3 for this. It is a nice transceiver and it does a good job, but if I wanted to do some other operation on HF (which I admit recently has not been too often) I would have to close down the gateway while I did so. I could use another transceiver for the gateway, but it would not be as stable or have as good a receiver as the K3 and the output power would be QRP because the K3 is my only 100W transceiver.

So I would like to know how others who run APRS on HF operate. Is it common to run a gateway just when the transceiver is not being used for something else, or would it be better to run it all the time even if that would mean using a radio with inferior performance? I know it would be better to buy a second K3 for my APRS gateway but for some reason the XYL doesn't think so. :)

Julian, G4ILO

Topic: 7800 Message: 7801

Same problem here.
I would like to run a full time gateway but because of the possibility of a lightning strike, which are common in this area, I can't afford to use an expensieve rig. Here is my idea of what to look for.
1. Any digital HF rig that works and is stable.
2. Any digital Hf rig that the only rhe receiver works for rx only gateway.
3. A digital communications receiver for rx gateway.
4. A HF marine radio that can be converted to 30M.
5. And last military surplus hf equipement.

If we keep looking at ham fests, estate sales, surplus stores we will find something.

73 and good luck

The ISS digipeater isn't on all that often. Check the ISS Fan Club website to find out if it's been heard recently.

There is a program called UISS that has been written more specifically for working through the ISS. I think it has an option for a gateway.

Nice site to track sats. But I don't see any freq information. I have been using Satscape and works great! Problem is I just have not been able to hear any of them. Not even the ISS when it comes overhead. Do they turn off the ISS radios? It has been coming overhead during the late evenings and I don't hear data or voice on 145.825 or 145.80.

7811. Garmin Street Pilot III with 710

Yahoo group: APRS (2007 — 2010)
Date: 2010-07-13 15:48:43 UTC
From: Paul-G0HWC
Topic: 7811 Message: 7811

Hi all,
I have just picked up a Garmin Street Pilot III and
would like to know if there is a way to make the
callsigns stand out from the place names ?

Also can anyone point me to a decent replacement
antenna for it ? It often comes up searching for
sats.

Hi,

there are plenty of after-market GPS antennas available on eBay. I've used one myself, though I can't remember the brand. It's magnetized and sat on the roof of my car.

As for callsign icons, no, there is no way for GPS receivers to display an APRS icon, at least as far as the dozen or so Garmins I've used. The ONLY GPS that will do this is the AvMap G5. This unit has been designed to work very closely with the Kenwood TM-D710A, to the point that it includes a cable to connect the 2 devices.

I don't know of a way around the standard default icons. I currently use a Garmin 376C connected to my 710 and I just see gray square icons.

hope this helps

Paul, that's an older GPS that's true RS-232 NEMA, so it should work fine. What you need to do is go into the menu/setup on the GPS, in the display area and change the size of cities and streets to a smaller font and increase the size of the waypoints. I don't have the exact steps. If you need more direction than that, you should be able to d/l a manual from Garmin's www site. Also make sure you have the latest firmware.

7814. Appalachain Trail and Pacific APRS Event

Yahoo group: APRS (2007 — 2010)
Date: 2010-07-14 16:11:17 UTC
From: Robert Bruninga
Topic: 7814 Message: 7814

Subject: Appalachain and Pacific Crest Trails APRS Events

On 25 July please consider participating in this year's APRS Golden Packet Attempt along the Appalachian Trail and Pacific Coast Trail. There was mention on page 99 in July's QST. Please see the web page:
www.aprs.org/at-golden-packet.html
www.aprs.org/pct-golden-packet.html.

All it takes is a mobile with a D700 or FTM-350 to drive up to the top of the mountain and park for 4 hours (though some sites may require more effort)...

Many teams have formed, but the New England area has many gaps from New York to Maine:

Sam's pt NY (not manned in 2009)
Mt Greylock
New Hempshire (innop in 2009)
Mt Washington (2009 team all moved to texas)
Middle Maine (not manned in 2009)
Mt Katahdin (not manned in 2009)

Also these southern sites are not yet solid:

Huntsville AL
Lookout Mountain TN
Roan Mountain NC (maybe)
Comer's rock VA (not operational in 2009)(near Wythville)
Apple Orchard Mtn (near Roanake

It's a 4 or 5 hour event on Sunday Afternoon and a great way to escape the heat down below by getting up there on the mountain top. If you cannot participate, spread the word, and find an out-doors type that can. Most sites are DRIVE-UP sites, so just about anyone with a car and a D700 or FTM-350 can participate as a temporary digi site after proper set-up.

Think of it as APRS Field Day.

P.S. I do not own an FTM-350, so if someone would write up the text file on how to configure it for this special event, it would sure help.

Bob, Wb4APR

Hi to the group,

I am new to this group. My name is Geoffrey, ham call F4FXL and i am 30 years old. Being a ham since 18 months and dealing with APRS since january 2010 this year i joinded this group to share and improve my knowledge about APRS.

I know if you have concerns about privacy you should not transmitt on APRS, indeed i have no problem with that. What i am concerned about is that all of my position reports are forever stored on websites like aprs.fi, openaprs.net ....
I do not mind anonymous people to see real time (i.e.: live) where i am, i have more concerns for anonymous people being able to track down where i have been several years ago.
Of course, i can add NOGATE and/or RFONLY to my path but that would prevent all of my packets to go to the internet. I searched a little bit and there is no way to tell the APRS websites no to store my position reports no longer than a certain amount of time.
One could imagine adding something like PERS24H (short for PERSIST FOR 24 HOURS) and the websites should regard this in the path and not store the position reports any longer than 24 hours...

Do not get me wrong, i have absolutely no problem with my real time position being reported to the web. I have concerns about my past positions being stored forever.

What do you think about this ? Have you privacy concerns abou APRS ?

Thanks for reading, 73

Hi,

When tracking satellites it is very important to have up to date kepplerian elements in your tracking program. Today i had a very favorable pass (site 89° !) but the ISS was 5 minutes later than expected : maybe the station got a reboost thus making it orbite higher.

I just had a second pass a few minutes ago and i managed to go through the ISS APRS digi with only 9W on a vertical antenna.

To go through the ISS APRS digi you should use RS0ISS-4 in your path.

Geoffrey,

I look at it like this. I'm not going any place I shouldn't be, so I'm not worried if somebody wants to track my dots 2 years from now. If I WERE going to go someplace I wouldn't want to be tracked to, I could always shut off my beacon.

With traffic cameras, electronic commerce, and at least a dozen other electronic Big Brothers everyplace we go, privacy is pretty much a thing of the past anyway.

73,

Mike

Geoffrey,

You might consider using a tactical call sign, and use your actual call sign in the comment field. You can change the tactical call sign as often as you want, and it will be much harder for people to check your post-facto locations.

When I test transmitters, I use a GPS data simulator that puts my position either off the coast of Madagascar, or in Sweden....Sometimes within seconds of each other... I wonder what someone looking at my "locations"would make of that! FYI, I have heard that sheep are known liars...

Geoffrey,

Of the 2,000 different ways that anybody's privacy could be invaded, APRS would be about 1,994. Yes someone could "click" on your APRS icon and checkout QRZ.com or something for you're address, but it really doesn't take APRS to make that happen either.

The good thing with APRS and privacy, is that YOU have control of whither or not anyone can "track" you, just turn it off. Using APRS is a volunteer system. Now if the government or some other "big brother" tacked one onto me, then there would be issues and problems.

But otherwise use it/learn it/play with it and enjoy.

Also, I'm not sure, but I don't think the raw data is NOT stored forever, hopefully someone with more knowledge could answer that.

aprs.fi stores data for a year. I don't know about other sites. Since the information is publicly accessible, the security services could be storing it forever and they wouldn't tell you anyway.

If you are worried about your whereabouts being electronically tracked, you should also never use a mobile phone, stay off the internet and never use credit cards.

As someone else said, there is no longer any such thing as privacy. If someone wants to find where you've been, they will.

Geoffrey,

I can understand your concern for position reports being made available to anyone who searches for them. But I would think your position a year ago would be of less concern than where you are at this exact moment.

Really it's no different than google or archive.org that makes stored copies of your website, pretty much indefently. Atleast getting them removed is an act of god.

Anything that goes over the internet is public information that anyone can, and will store for their own purposes.

Well I guess if people are concerned about position then maybe those people should ask QRZ and the FCC not to publish

Your calls and address. Maybe someone will look up your calls when you tell everyone on the air that you are going on vacation and

They can come by and grab your ham radio gear

Just my thoughts

I too find this an odd concern. I would have more problem with someone knowing my real time position than my position of a year ago. If you are concerned about someone seeing that you were someplace you shouldn't have been you should probably kill the radio while you are there. Just a thought. But someone knowing that I was at WalMart for two hours three years ago is not really a big concern for me.

Rahn

Hi all,

Thank you for all of your replies ! In france you can ask the ANFR (equivalent of FCC) to not publish your address. If someone looks up your call in their database the system just answers : "The call is assigned".

As far as i know APRS was meant to be a real time information system, so tracking information from one year ago is not that relevant. Except for tax inspectors ;)

If i summarize all of your answer there are two solution to my concerns : use tactical calls or do not gate to the Internet using RFONLY/NOGATE. Since France has a very obsolete hamradio regulation i am not sure about tactical calls being legal, even with the legal call inserted in the comment field. I am not even sure if automatically beaconing from a mobile is legal. I'd better not ask so that administration leaves the APRS users alone...

As previously said, privacy is a thing of the past anyway so why should i worry about APRS ? ;)

Hi All,

You bring up a very valid point Geoffrey.

(As far as i know APRS was meant to be a real time information system, so tracking information from one year ago is not that relevant.)

So why is it stored for so long.

Robin ZL3REW.

I think you have made a good point "in France...".

Every jurisdiction has different rules regarding data retention & privacy and the international nature of the Internet is a huge legal challenge to the "norms" of any single country.

In the UK a callsign is classified as a personal identifier (the person can be uniquely identified from it), so any data held against it falls under our Data Protection Act, BUT only if the server is in the UK. As there are very few here, it's a moot point as the data can be obtained offshore.

As others have said, there are plenty of other ways to also track you, so just switch position ambiguity on and beacon away!

Jim, G1HUL

You would have to ask the owners of aprs.fi, openaprs and the other APRS websites that question.

Why is the information stored on the internet at all? Probably because people want to be able to see tracks, not just where someone is at the moment. Would anyone be interested to see the track of where they or someone else (a balloon?) went a year ago? I guess it is possible to think of cases where it would be useful to be able to retrieve the information.

In the FAQ of aprs.fi it states: "Amateur radio transmissions are defined to be in the public domain (by FCC rules in the US, and by respective legislation in most other countries, and I suppose, by international regulations). Anyone can receive them, and retransmit, publish or store them as they wish. If you do not wish your position to be published on the Internet, the only guaranteed way is not to transmit it."

I think that sums it up, really.

Yep, in some cases having information dated one year ago can be helpful especially for balloon projects, but for the rest of the time more than 1 or two days does not make sense (at least to me).

In France hamradio is public domain and can't be monitored by anyone. However it is not allowed to retransmit or record transmissions for any other use than personal use, as you said this is common problem of the Internet and privacy.
BTW in France connecting a hamradio equipment to the internet is illegal i.e. echoling and APRS iGates are illegal. I am leaving near German border and all of the french APRS trafic is gated through german igates... Maybe we should move to the SSN-n paradigm...

The paradox with my privacy concerns is that i want people to be able to know in real time my exact position, but not to keep track from it several month ago.

I had heard that connecting ham radio to the internet was illegal in France as there is a bit of a campaign at the moment to allow D-Star. But there certainly are APRS gateways in France, it only took a few seconds using aprs.fi to discover one.

There are tracking systems that don't use ham radio which might meet your requirement. Alternatively you could set up your own receiver at home on a different frequency than 144.800 and set your tracker to that frequency and then your position reports would only be received by you. But if you need the APRS network for coverage of the area you will be moving about in then I don't think there's a solution.

Yes you are right, there is a campaign for D-Star but this is an other topic.
I am into APRS for the other ham to see when i am on the go or at home for the other ham to see my current status. Actually a state wide coverage would be enough for my needs.
I'am considering adding RFONLY and NOGATE to my path and maybe try to set up a kind of private website where only authorized persons could track me....

7837. UI-View 32 not showing up on Kenwood d7 and d700

Yahoo group: APRS (2007 — 2010)
Date: 2010-07-19 16:34:25 UTC
From: kb1ejh
Topic: 7837 Message: 7837

I tried the message search feature but Yahoo gives me a server busy error 300.

I have set up UI-View32 and it is registered. It beacons, sends messages, receives messages. The beacons from the UI view will not show up on the Kenwoods. I hit PMon on the d700 and I get info from the UI view beacons but it will not show up on the list. It does not even say it is out of range.

Ideas?

Carl, kb1ejh

An interesting and valid concern, Geoffrey.

I would venture a guess that many of the people who tell you this is NOT a concern, have no idea how many scams and crimes are bing committed using publicly posted information from web sites.

One of the more common ones in the US is the "grandchildren" scam, which was being run mainly out of mexico and now out of Canada as well. The criminals use public information (one victim thought it was from a Sendeo? social web site and closed their account their quite recently) from social web sites to determine who is retired with grandchildren of college or high school age.

Then they make a phone call to "grandma" or grandpa, using the publicly listed phone numbers, and say something like "Hi, this is (grandchild's name, harvested from web site) I don't wnat you to worry but I've been arrested (or I'm in the hospital) in Tijuana (or Toronto, etc.) and I need a thousand dollars to get out and get home to get this straightened out, can you send it to me Western Union?"

The scams are enough of a problem, and they take in so many victims, that police and newspapers in retirement areas (like Florida) keep running warnings to their communities NOT to believe the calls.

Yes, there are criminals out there, and yes, they are smart enough to use web sites. At some point, one must assume that someone will figure out "Ah, this ham radio person has posted pictures of his station. he has expensive radios and he's a thousand miles from home this weekend, I think I'll go help myself!"

It is a valid concern, how you choose to address it is a personal choice. I don't know of any ham shacks that were cleaned out this way, but do know of one photographer who was burgled as a result of mentioning he'd be away from his home for two weeks. Then they robbed him a second time, after they say the boxes from new replacement goods stacked up in the trash a few weeks later. (That's also not uncommon in the US. Crooks aren't always dumb.)

It's hard to blame the crooks when you post pictures of your stuff and tell them you're going to be out of town.

I thought it was that way from the beginning, Scott!

The person who appears to have the most privacy in the entire world is Bin Laden. Anybody want to go live in a cave?

I can see how letting my current position be known to the world could cause problems, but who cares where I was two years ago? Again, if I'm gonna go someplace I don't want to be tracked, I can turn the tracker off!

If people knew how many times there were photographed every day, they would not be concerned about APRS.

Now... (he said, in a desperate attempt to change the subject), anybody done any cool stuff with APRS lately?

73,

Mike

But in 5 days we will be doing some REALLY cool stuff with the APRS Golden Packet Event. Both along the Appalachian trial and Pacific Crest trail, plus any other long linear trails we can get APRS stations on.

See www.aprs.org/at-golden-packet.html

We still need 5 sites manned From NY on to Maine
And one in the middle of SW VA and one on lookpout mountain in Chatanooga and one on Huntsville mountain.

Please see if you can round up some out-doors types so we can get those sites manned!

Bob, WB4APR

Bout time somebody spoke up on that subject,I already have some APRS haters in my area that they think that APRS is a spy mode and they don't want their position known,and the mention of APRS on the repeater is NOT to be mentioned and any newsline reports that contains said mode does not get aired on the repeater net.with that said I'm very well involved in APRS including the use of the International Space Station Digi and I'm currently experimenting with Xastir the Linux version of UI-View32 that means I operate both Windoze and Linux.

7848. Re: My position report on websites and privacy....

Yahoo group: APRS (2007 — 2010)
Date: 2010-07-20 05:05:11 UTC
From: maxx2950
Topic: 7817 Message: 7848

Yep you missed the point that my concerns where about anonymous people being able to know where i have been one year ago not being able to see where i am in real time. So running position ambiguity is not the trick.

Actually most of the people that want to track me on air are hams so no problems for those, they have all the equipment required !

The solution to my concerns is to not gate my position to the Internet thus not feeding the websites.

7849. Re: [APRS] Re: My position report on websites and privacy....

Yahoo group: APRS (2007 — 2010)
Date: 2010-07-20 05:45:00 UTC
From: Steve Hays
Topic: 7817 Message: 7849

I am 1 of the top 4 hit-men in the US. Jimmy Hoffa was one of mine. Whenever I am on the job, I turn APRS off. Actually, I take allot of steps to remain anonymous. No cellphone, I leave the truck with the "Ham Call" license plates at home and instead have my private servant who is Blind, deaf and dumb (You can't be too careful in this business) drive me out to the hide-out where I keep the nondescript car with the counterfeit license plates. I wear a disguise whenever possible. :-)

7853. Re: My position report on websites and privacy....

Yahoo group: APRS (2007 — 2010)
Date: 2010-07-20 07:56:35 UTC
From: g4ilo
Topic: 7817 Message: 7853

That is flawed logic really, because if your ham buddies can track you there is nothing to prevent anyone who wanted to from storing those received positions for as long as they wanted. My APRS software has the facility to store anyone's track, and I could keep it for as long as I want.

I am using Satscape to track all Amateur Sats and ISS. IT is acurate and watch ISS overhead at night. But I guess they must be sleeping, because I never hear anything. Listen on 145.80 for voice, and 145.825 for data. All the websites I seen said to use ARISS in the Unproto path. I guess I will update it to RSOISS-4.
Thanks, Kevin

You don't need no clunky PC software. Just create a bookmark with this link: http://www.n2yo.com/passes/?s=25544 . Create an account and log in to the site and tell it your location so it knows where you are. It will remember this whenever you access. So you just click the bookmark then check the box to show ALL passes (since you don't need to see the ISS to work it) and there you go.

It won't tell you whether the digipeater is on, though. Try the ISS Fan Club website for that.

ARISS has always worked for me.

Not that I'm saying an operator isn't free to operate their amateur radio station as they see fit, but "position Ambiguity may run afoul the FCC prohibition against transmitting false or deceptive messages". Anyway one's world wouldn't come to an end if they turned the darn thing off, to cover all bases.

so in your country you aren't allowed to tell with your voice on the
air "I am at home" if you really are on the beach?

I think that interpretation of the FCC rule on false/deceptive messages when it comes to position ambiguity is stretched too far.

Position ambiguity, if you read what it really does and not what its name implies, doesn't really "fudge" or ambiguify (my word) your position. It simply reduces the precision of the transmitted position by blanking out 1 or more of the least significant digits. The spec says that the receiving software should interpret this as ambiguity in certain ranges, but in fact, the packet itself contains full precision in one coordinate and reduced precision in the other. So, the packet actually says you're somewhere on a line segment on the map. If you overlay an ambiguity transmitting mobile station on a map of the available roads in the area, it's actually not ambiguous at all.

Were you using that when you were walking up in the hills in Spain, Lynn? Your track on the map looked like stairs, zig-zagging from one side of the path to another. It looked like the co-ordinates were being rounded to a fairly coarse resolution.

Topic: 7817 Message: 7862

No, I wasn't using position ambiguity but I'm not sure if I was
transmitting DAO either. The default for APRS is hundredths of a minute
which makes the dotted grid when you zoom in on a fixed station running
a drifty GPS.

The most probable reason for the zig-zag tracks is that I was walking up
switch-backs. I know I did one big one like that when I was at the one
monastery in the mountains. I went from the lower trail up 600 feet to
a trail that was only 100 feet linearly away to get a geocache. LOTS of
switchbacks on that one.

In APRS, there's no such thing as a "rule", just guidelines. And as such, the answer to your question is No. Especially when some software authors (myself, in particular) were not aware of NOGATE. The "rules" are way too fragmented and de-centralized for universal application.

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile and Win32
(which will soon honor the NOGATE, although the APRS-IS central servers may be covering for me)

Been there, done that website. A nice site, yes. But I prefer a standalone program. I really like Satscape so far. Plus I can view Satscape and other packet software in a split screen much better. Going to do the ISS Fan Page.
Thanks, Kevin

7869. RE: [APRS] UI-View 32 not showing up on Kenwood d7 and d700

Yahoo group: APRS (2007 — 2010)
Date: 2010-07-21 12:39:46 UTC
From: Adam Mahnke
Topic: 7837 Message: 7869

My first question would be, what do you have your UI-View set up connected to? Radio? Internet Only?

If it's hooked to a radio, are you sure it's beaconing out at all?

Subject: [APRS] UI-View 32 not showing up on Kenwood d7 and d700

I tried the message search feature but Yahoo gives me a server busy error 300.

I have set up UI-View32 and it is registered. It beacons, sends messages, receives messages. The beacons from the UI view will not show up on the Kenwoods. I hit PMon on the d700 and I get info from the UI view beacons but it will not show up on the list. It does not even say it is out of range.

Ideas?

Hi Kevin,

Go to this site and scroll down to the station list and it will tell you how long it has been since ISS was heard on APRS.
<http://www.ariss.net/>
I see the digi was active on the last pass so I'll check them
out on the next pass.

I use Orbitron for pass prediction and UISS for APRS messages.

A good place to look for ISS information is http://www.issfanclub.com APRS is active now.

Amateur Radio status reports are on the right side of this page. The amateur radios are often turned off due to crew or shuttle activity. These pages will indicate current mode of operation, if there is any active amateur radio transmission.

This link will show the next 10 times the ISS will be over any location.
http://www.issfanclub.com/tracking

Several programs will predict the ISS path for several days in advance. My favorite is Ham Radio Deluxe, a free program (Windows only) that does much more than satellite tracking.

Hi,

When ISS is above your head you can receive it with a HT and rubber duck !

7880. Not getting to an igate.

Yahoo group: APRS (2007 — 2010)
Date: 2010-07-25 05:25:54 UTC
From: Rahn Abbott
Topic: 7880 Message: 7880

Hello, I am just now starting to get back into APRS. I have old settings in my D700. Currently I am running a path of WIDE1-1, WIDE2-2. I am using the callsign of W7DOA-7. And I am now in what the locals consider NW Kansas. Although, it's nearly central. I live in a little town called Wakeeney on I-70. Right in town it's kind of hit or miss whether or not I get an acknowledgement when I beacon a position. However, when I get outside of town a few miles on the interstate I start getting ACK's. and I will show up on the internet. The last reported position was a few days ago in Hays, KS. However, today I was running around south of Wakeeney in the Cedar Bluff Reservoir area and was getting ACK's all day. But when I went to check my positions this evening the last heard was still in Hays a few days ago.

Is this because my path isn't right or was I just getting to a digi that is not gated and my packet doesn't go any further? I was hearing stations all day and didn't really take a look at what they were or where they were being heard from. Any help would be appriciated. Like I said it's been a few years since I have worked with APRS and I feel competely out of the loop.

Thanks again.

Looks alittle dead out there, pulling up the coverage of the digi's
there, it seems like nothing is covered, but I think the digi's
probably aren't sending proper range info. The packet that did make it
to the internet from you, happened cause someone local there had an
igate setup, but they have had it off for the last 6days now. The
packets that are still making it to the internet from that area are
getting to grand island, NE. I would say there is just a take of igate
around you, that is causing the issue, besides digi coverage, but you
know that.

To see APRS traffic at a high level in the US, go to

http://ldeffenb.dnsalias.net.nyud.net/Tracking/Act24/*

or

http://ldeffenb.dnsalias.net.nyud.net/Tracking/Act00/*

The first plots 24 hours of usage and the second does approximately 10
days accumulated usage. The trailing * is required on both. Scroll to
the bottom for the most recent plots.

Straight lines of a track are usually airplanes, so don't count those as
ground coverage. Otherwise, from these plots (especially the Act00) you
should be able to tell if you can expect coverage in any particular area.

Lynn (D) - KJ4ERJ - APRS Infrastructure Visualization

PS. I plot a total USA coverage as well as quadrants (NE, NW, SE, SW).
The quadrants have higher detail.
(0) is all traffic with lines - Very busy plot, but holes are really visible
(2) is Digi/IGate traffic eliminating things that move
(4) eliminates lines and labels making it easier to see tracks of actual
locations

7884. APRS Local Info Initiative

Yahoo group: APRS (2007 — 2010)
Date: 2010-07-26 05:07:50 UTC
From: adilinden
Topic: 7884 Message: 7884

Hi,

I am operating a Digi and iGate. I am curious about the proper format for various object to be "advertised" via the Digi as per the APRS Local Info Initiative (http://www.aprs.org/localinfo.html).

I am trying to pull the information together on how all those various beacons are to be formated:

- Digi beacon
- iGate beacon (??? probably not?)
- Voice repeater beacon
- IRLP node beacon
- Echolink node beacon

Anything else that should be advertised? The other thing is that symbols use seem to have changed a little since I last looked at my digi config. So I am hoping I'll eventually find out what proper symbols to use for those various beacons.

Thanks,
Adi

From: Robert Bruninga
Topic: 7885 Message: 7885

Several teams report successful long haul APRS text messaging along the Appalachians during yesterday's annual Golden Packet event. APRS -not- on the national channel was used. See www.aprs.org/at-golden-packet.html

APRS Text Messaging Comms were good from Springer Mountain in GA, though Clingman's Dome in the Smokies to Roan Mountain NC. Like last year, the Comer's rock site near Wythville VA was not activated.

Then starting again on Apple Orchard Mountain near Roanoke VA, going north through the station on White Rock Cliffs on the VA/WV line and through the Maryland Mountain station, links were solid to GD Hill in SE PA. From there north, apparently, none of the new-england mountains were manned this year.

LESSONS LEARNED! Don't carry 52 AH worth of batteries up the mountain, when the D700 digi/voice rig can operate just fine for 4 hours on only 3 AH at medium power!

Also don't carry a laptop and all those batteries, when you can do all the messaging from the radio front panel. PLAN ON 105F temperature/humidity going up, and then Thunderstorms, hail and wind while up there.

We didn't carry the table and chair this year and will be even further trimmed down next year. Our plan will be:

D700 DIGI and UHF simplex coordination voice
APRS HT for 144.39 all-site comms using CQSRVR messaging
DUAL BAND HT for local coordination/monitoring local repeater
DUAL BAND HT for monitoring repeater of next station N and S

The HT's ran all day on their own batteries and I think a good 4 AH battery will do for the digi if only the 4 hours are active. All this will easily fit in a single day pack.

For next year, we need a committed team in SW VA and other teams throughout the Northeast sites north of PA to Maine. The Pacific team didn't have time to fully prepare and are starting planning for next year's attempt along the pacific mountains.

My site was www.aprs.org/hamtrails/GD-hill.html
Other reports still coming in.

Bob, WB4APR

7886. Canada APRS Coverage (was: Not getting to an igate)

From: Lynn W. Deffenbaugh (Mr)
Topic: 7886 Message: 7886

Bruce,

I've generated East and West plots for the data I still have in my
database. You'll find them at:

http://ldeffenb.dnsalias.net.nyud.net/Tracking/Act24/*CANADA*

I extended the West plot further North than you described to pick up a
pair of stations within the round-off factor of OpenStreetMap.org tiles.

I'm now working on the accumulated plots from the 20th to the 25th.
They should be done and posted sometime tomorrow to

http://ldeffenb.dnsalias.net.nyud.net/Tracking/Act00/*CANADA*

I use a distributed proxy server (coralcdn.net), so if you don't see
anything listed, wait a few hours for the cache to age out and try again.

These two plots are also in my daily run now, so new ones should appear
daily as long as I keep my batch job running.

Are you sure you are using the kiss 4800baud firmware?
The normal firmware for kiss runs at 9600baud.

Other than that, just tell uiview that it is a kiss modem, no init
string needed.

From: vk1nut
Topic: 7369 Message: 7890

Hi Scott,
I have a D700 with a new GTRANS cable (Thank you -works a treat)and a Nuvi 350 and I am finding the aquisition of birds now takes a lot
longer with the nuvi than with a external mouse gps (which has a mini din connector and does not plug directly onto the Nuvi)I used before I aquired the Nuvi.
I have the d700 set for NMEA now as NMEA96 fails to aquire.
So I think it would help if I add an external gps antenna that is powered all the time.
But I don't know how this can be done with the GTRANS cable.

I was also trying to reduce the number of connections to the Nuvi for when I remove the Nuvi to be out of sight from thieves.
-Paint the Nuvi matt black??? ha ha.

What do you think?

Glenn,

If you look closely at your Nuvi 350, you will find an MCX connector for an external GPS antenna on the flip-up antenna. This still allows the G-Trans cable to remain connected. In reference to your statement on NMEA96 failing to acquire, that is NMEA 9600 baud. Your TM-D700A requires NMEA 4800 baud, hence the acquisition on the NMEA setting. You would still have three connections to the Nuvi 350, and it is really hard to hide all those cables. Matte black? I like the idea, and just might try that with mine. Good luck.

7892. A note of THANKS for the ISS assistance

Yahoo group: APRS (2007 — 2010)
Date: 2010-07-30 21:42:54 UTC
From: bkanne
Topic: 7892 Message: 7892

Hi all:

I am back in Atlanta and wanted to express my thanks to all who commented and offered suggestions regarding my use of the ISS digipeater while I was traveling in Glacier and Yellowstone National Parks. I was able to access the station virtually every time I heard it and ended up using my TM-D700 in the car into a 1/4 wave whip on the rooftop as my end of the link. I received several reports from some of my home ARES group who were tracking my trip that they got good fixes on my location on those occasions when I heard the ISS. Although I didn't have any specific data, I generally heard it either twice or three times a day at about 90 minute intervals.

Although I know you have to take Doppler into account, I found that just using 145.825 was sufficient. Evidently my receiver was wide enough not to be bothered by any slight frequency shift.

When I returned I delivered a short report to our local ARES group on the merits of using the ISS as a digipeater in an emergency. Many of them had seen the results first-hand.

Again, thanks to all!

73,
Barry, W4TGA

Thanks Noel.
I figured just as much.I will start looking for a mouse gps with a right angled mcx connector if there is such an animal.
The "black Nuvi" solution is looking better every time I think about it.

Cheers

I'd worry about heat on the black Nuvi. I know my black Tilt gets
really hot unless I lay a white napkin over it.

Glenn,

You can look in Mouser's catalog and Tessco's catalog. Also go online to ebay and search there. Might try Garmin's site, too. My eMap uses the same connector.

Thanks Noel.
I figured just as much.I will start looking for a mouse gps with a right angled mcx connector if there is such an animal.
The "black Nuvi" solution is looking better every time I think about it.

Cheers

Hi Lynn,
didn't think about that! It would get pretty hot even without the black colour.
For living on one of the hottest continents you would have thought that it should have crossed my mind once or twice!!
Probably because I live in the
Maybe I could make up a cover much like the Nuvi pouch but have it slit in the right places to just drop over.
Should be pretty ugly but maybe "out of sight is out of mind."

BTW I did find a mcx mouse gps with a right angle connector locally in OZ on ebay, thanks Noel for the tip.

From: grumpyguard2000
Topic: 7897 Message: 7897

I am new to APRS and purchased the Foxview3. I can not get this to work as an APRS tracker. I am torn between the Byonics Tiny Track4 and the Argent Data Systems Open tracker 2. Any suggestions? I will be using an Icom IC-W32A for the radio and for now a Garmin GPS60, but hope to upgrade to a Nuvi 855. I am using a universal mic for the Icom, and I figured the pin out as:

White = Mic Audio
Black = Ground for the 3.5mm plug
Red = Ear/Speaker Audio
Bare = Ground for the 2.5mm plug

Do I need to add a resistor to any of these wires?
I know these are a lot of questions,but I should have done this first before wasting my money.

Thanks for the help.

the website for Foxdelta says that the Foxview3 can be used as a tracker and/or a "Fill-in" digi. It does, however, require modifications to use these.
My experience with the Foxdelta units is that you will get no support at all from them.
Both Argent and Byonics have excellent units and provide full support via Yahoo groups.
Have a look at them before wasting anymore money.

I own a TinyTrak4, an OT2m, and a T2-135 and run all three. There are similarities (they're all good, reasonably priced, and are APRS TNCs), but there are also differences... Here's my $0.02...

TinyTrak4 - DSP-based and therefore capabilities are expandable into the future. Closed source, so it can only do what the developer codes it to do. Works well as my KJ4ERJ-1 WIDE1 Digi/IGate (KJ4ERJ-7 is the TT4) as paired with an iCom T22A HT. I bought this one both for what it does now, and what it can possiblly do in the future.

OT2m - Has 2 serial ports, so it can do GPS and TNC work at the same time (I don't remember if the TT4 can do this or not, so this may not be unique). Hardware AX.25 tone decoder, tight on code space - This means what it does now, it does and isn't outstandingly leveraged to do other things. However, it is open source, so if you want it to do something different, you can re-program it yourself. I use this in my KJ4ERJ-9 mobile paired with an Alinco DR-135 and at times Bluetooth linked to my APRSISCE client on my cell phone for mobile IGate duty.

T2-135 - Basically the same hardware as the OT2m, but with a single serial port, so it can do GPS or TNC, but not both at the same time (well, sort of, but too detailed to get into here). The big selling point on this one is that it is an internal board for Alinco DR-135 radios giving you a single package with no external wires except for the GPS. I use this as KJ4OVQ-9.

One of the coolest things about the OT2m and the T2-135 (the Tracker2 family) is that they can speak FMI (Fleet Management Interface) to Garmin Nuvi GPSes to do bi-directional APRS messaging and display of received station positions, all while still doing their internal routing and directions. However, you mentioned the 855, but all Nuvi's except the 350 don't work well for displaying received stations. They display a breadcrumb trail of all positions quickly overflowing the 500 (I think, maybe 100) limit on waypoints in the device. So, if you get Nuvi 350, they're really sweet!

The Nuvi 350's arent readily available, (discontinued?) have they been replaced by another model that does close to the same thing as easily and as well as the 350?

That is a lot of information. I am considering the t2-135 as a cost savings because I do have the Alinco 135, but I don't know if I want two mobile radios in the car. I like the thought of being able to remove the aprs from the car and use it while geocaching or during t hunts.

Lynn thanks for the information and your $0.02 cents.

I have to agree with zl1gbb, that guy at foxdelta does not help you for crap... I bought a fox digi that to this very day its purpose is paper weight after I spent countless hours trying to make it work and trying to get some help from his group but help never arrived. save some money and spend it wisely on a tinytracker or argentdata opentracker+ that guy (cant remember his name or call sign)at argentdata is awesome, I recommend doing business with him.

7904. Scouts High Altitude Balloon ATV/Repeater/Digital Mode Beacons, August 7th

Yahoo group: APRS (2007 — 2010)
Date: 2010-08-03 02:31:20 UTC
From: Mark Thompson
Topic: 7904 Message: 7904

http://forums.qrz.com/showthread.php?t=258523

High Altitude Balloon for Scouts to carry ATV/Repeater/Digital Mode beacons on Aug 7

To Radio Operators across IL, IN, WI, OH, MO, KY and beyond...

August 7th, 2010 as part of the Scouts Space Jam Technology Merit Badge Workshop, more info at http://spacejamboree.com, 2 helium balloons will launch with ham radio aboard... details below, we appreciate signal reports, or participation.

Balloon 1 (DePauw University BASE Flight 48)
schedule to launch approx. 8:00 CT from Rantoul, IL
APRS Tracking 144.390MHz using callsign N9QGS-11 every one minute with no path
DominoEX-22 followed by 300 baud ASCII RTTY (200 hz shift) every minute with Morse code ID every 5 minutes. Flight can be tracked
at http://www.spacenear.us/tracker
Amateur Television from balloon on 434 MHz NTSC
Flight scheduled for 1000/ft ascent till burst at ~95,000ft

Balloon 2 (DePauw University BASE Flight 49)
schedule to launch approx. 8:30 CT from Rantoul, IL
APRS Tracking 144.390MHz using callsign W9YJ-11 every one minute with no path
Cross band repeater with input frequency: 144.360 MHz and an output frequency: 446.025 MHz down, no PL, please check in with net control (contact with ISS and scouts possibly may be rebroadcasted during flight through balloon.)
A float valve will be used to keep repeater up at 60,000+ feet for approx. 90 minutes; Estimated time for cross band maximum range should be approx. from 1430 UTC till 1600 UTC and above 45 kft from 1415 UTC till 1630 UTC.
DominoEX-22 and RTTY 300 baud (200 spacing) Ascii every minute on TBA frequency and callsign (watch twitter for this information)

How to follow the action on the internet:
You can track the balloons using APRS technology at http://tinyurl.com/2ed2u85
Watch decoded DominoEX/RTTY flight data at http://spacenear.us/tracker

Hi

Is anyone aware of any APRS software that will run on a Symbian phone,
specifically a Nokia E71.

Almost certainly no.

I did start to develop PsiUI on EPOC but did not have the time to
finish it into a fully useful app.

I did manage to find one that sort of works mgmaps version 1.28.06

It's a pain to setup and the maps don't work, seems APRS was removed after this version, and despite promises to put it back it has not been.

I wonder if someone cleverer than I can have a look at it.

Hello,

I just got my first android device, a pandigital novel that I freed from it bonds and am finding to be a pretty useful form factor for a computing device.

I am a unix programmer and have already started setting up my android development system, applied for all the google app/code/market stuff.

I have just went thru a wave of compiling and getting stuff like Xastir, HAMlib, aprsd, fltk, fldigi, grig, portaudio and some supporting libs, etc working for PowerPC Macs users running 10.5, um, like me and my PowerMac G5s! I know that some of that was already available for PPC users but there is the learning experience to consider.

Now I think I will start compiling things up for android pretty soon. I was leaning toward fldigi first but maybe I should start with the aprs stuff?

I like HTC phones and when the next generation HTC EVO hits my carrier I think I am going to get me one. I still don't trust google as far as I could throw their data center tho...

7916. Robust APRS using WINMOR

Yahoo group: APRS (2007 — 2010)
Date: 2010-08-08 07:51:42 UTC
From: g4ilo
Topic: 7916 Message: 7916

I have frequently seen it stated that the FSK300 modulation scheme used for packet radio and APRS on HF works poorly because the modulation scheme is not well designed to cope with fading and multi-path effects and has no error correction requiring the whole packet to be sent again if there is even a single bit error. Because of that, SCS devised the Robust Packet modulation scheme but it is proprietary and cannot be used by other makes of TNC nor by sound card software.

I was surfing the web yesterday and came across a recently released program called the WINMOR Sound Card TNC. As the name suggests, it is a software TNC that uses the WINMOR protocol, which comes in 2kHz and 500Hz wide variants with FEC and can be used in unconnected mode. I am far from being an expert in this but it seemed to me that this open, documented and freely available mode would be ideal for robust APRS. Am I missing something here? To save repeating myself, http://blog.g4ilo.com/2010/08/making-hf-aprs-mor-robust.html has a bit more information.

I downloaded the G8BPQ stuff which has an interface to the WINMOR TNC and I managed to generate some WINMOR by typing at a terminal, but I was unable to get anything to be transmitted from an APRS client using the BPQ AGW emulation. Possibly this was due to a mistake on this side as the technical level for configuring this software is a bit over my head.

Nevertheless it seems to me (unless, as I said, I am missing something) that this WINMOR TNC could provide the answer to making HF APRS more reliable, if only developers would add support for it in their software. Any thoughts on the suggestion?

Julian, G4ILO

Winmor has the HF TNC already in it, if you go to the Yahoo group for Winmor you can get a lot of your questions answered. I have been playing with it for awhile now and find it a very good HF and V/UHF TNC.
The group is HERE <http://groups.yahoo.com/group/WINMOR/> and of course is free but you do have to register.

Clarification concerning WINMOR:

Julian had it stated correctly....

WINMOR TNC is a "soft" implementation of the WINMOR protocol developed by the WINMOR Development team led by Rick, KN6KB.

The developers created the "soft" WINMOR TNC so that other application developers could offer a WINMOR based protocol within their own digital communications applications.

RMS Express is the software application that is a full client implementation with the WINMOR protocol. This software application is emerging from beta testing and has been in use form many months now and is used with the Worldwide WinLink System and in peer-to-peer mode.

As Russ indicated, more information on WINMOR - plus the software downloads - can be had at the WINMOR Group:

APRSdroid is available at the following website:

http://wiki.github.com/ge0rg/aprsdroid/

I don't believe it is in the Android Market.....

Prior to download and installing on an Android smart phone, the setting to allow a non-market application to be installed must be set.
This setting can be found under "Menu" --> "Settings" --> "Applications" --> "Unknown Sources"

I use it and it works ok. It is not feature rich but it covers the basics well enough.

Darrell,

You may have already taken care of this, but...

I just got a good GPS antenna for my Garmin unit (60CSX) labelled "High Performance Amplified MCX GPS Antenna" for only 19.95 thats a Gilsson. It has worked great and is the same price for various cable lengths and also you choose straight or 90 degree connector.

The unit has gotten some great reviews.

Maybe they all do but I like that it has a build in magnet for mounting and they also sell a suction cup plate like the Garmin one.

Some prices for Gilsson can vary I got mine here (this link if for the Nuvi page):

http://gilsson.stores.yahoo.net/nu30313536nu.html

Hope this helps. Good Luck

7922. APRS for radio system testing

Yahoo group: APRS (2007 — 2010)
Date: 2010-08-18 03:31:17 UTC
From: Ray
Topic: 7922 Message: 7922

Has anyone used APRS for radio system coverage testing? I'm envisioning an APRS tracker that sends the location data over a 2-way radio channel. That's part is easy ;). At the radio system voter (signal comparator) site a signal to noise ratio is captured along with the coordinates. Say at a certain coordinate, you have 12 dB S/N. So after a lot of driving around you would end up with enough data to draw a color coverage map. More green, the higher the signal, the more red, weak signal.

I've seen systems that do this for the system talk out (base to mobile) but I'm looking for a way to measure the talk-in, 4 watt handhelds to the dispatcher. IMHO, this is much harder direction for any radio system.

I know we can get an analog level encoded in the packet at the TNC, but this would need the analog level measured somewhere downstream from the tracker. I would assume an A/D converter connected to a PC at the voter would be the hardware needed. What's beyond me is the software to grab the APRS packets, associate them with the analog level, then log it. For extra credit, the software would average the level over a second. I'm sure part of the set up would be to calibrate the noise on the audio output to a specific S/N level.

Does anyone know of a system that does this?

Thanks,
Ray KD4BBM

7923. Nuvi 350 with "Always on" external GPS Puck antenna

Yahoo group: APRS (2007 — 2010)
Date: 2010-08-18 10:26:37 UTC
From: vk1nut
Topic: 7923 Message: 7923

Is there a way of keeping an external gps puck antenna powered all the time (to reduce fix times) AND have the nuvi 350 only powered on ignition?
I don't want to run +5v that feeds an external gps puck back to the nuvi via the external antenna connection,- and do it damage.
Is this scenerio possible as I do have a puck that has a +5v input.
I would have thought a relay might produce nasty spikes when switching between them.

Thanks
Glenn, vk1nut AKA "NUTTERS"

Yep, Garmin GPS16hvs has a backup that draws a small current on standby, we use a PTT type single transistor switch to power up from the ign acc switch.
It has some other good features too, like wide power range of 6 to 40 volts (thats the hvs bit)
fully user programable for datum, nmea & garmin sentence out. Water proof, (marine style).
Only drawback is, it is larger than most puck type units.

I'm confused. Do you have an external puck antenna, or an external GPS
in the puck form-factor? If the antenna is connected to the Nuvi 350,
it's the former which is basically just an amplified antenna, not a full
GPS. There's nothing to be gained from keeping that powered as the Nuvi
is the actual GPS that will still need to get a fix when it is powered up.

Lynn (D) - KJ4ERJ - Nuvi 350 / OT2m / Alinco DR-135 as KJ4ERJ-9

Just a small correction and additions. The GPS16XHVS tech sheet shows 8-40 volts, but it 'might' work down to 6V but it has an internal 5V regulator so needs overhead. However, this unit is also RFI hardend. i.e. It is been designed so as not to generate any RF that could interfere with other communications or computer equipment. It is also immune to RFI. I have two of the GPS16XHVS and three of the GPS18XLVC. The latter definitely generates RFI, most notable on HF, but is also noticeable on my HP laptop speakers unless the puck is mounted a considerable distance away, like the back roof of a vehicle.

Except for its size, I like the GPS16X and use it the most, especially for a puck to set on the dash of my plane. Note too that the GPS16X does NOT come with a mag mount. It has to be ordered separately. It was designed to be mast mounted.

If you tap the signal strength icon you get a status screen with your coordinates... I don't remember if it also shows a compass. Touching one of the corners in the map display might do it, too.

But the Garmin GPS16x is not an antenna. It is a complete receiver and antenna in one unit. I suppose there is probably a way to connect it to a Nuvi 350 such that the 350 was functioning only as a display for the 16x, but why?

For Glenn, frankly I don't think what you want to do is possible. Think of it like having an active, pre-amp antenna on a receiver. Having the antenna turned on all the time isn't going to make the receiver start receiving any more quickly when you switch it on. Likewise, having an antenna that is on all the time isn't going to make the Nuvi 350 resolve its initial fix any more quickly. Either way the Nuvi is turned off, and it doesn't start receiving or processing signals until it is turned on.

Hi All:

Just wanted to let all know that the tracker2 and 350 Nuvi worked perfectly over the entire summer I drove with it. Nearly 15000 Miles from Boston to Minneapolis to Houston to Atlanta and much in between. Never a bit of trouble and had the aprs.fi maps embedded into my tour blog page.

I couldn't be more pleased with the overall result.

And to clarify, it is not just a dumb tracker. Although it is
not a kenwood or Yaesu, it outputs all surrounding APRS objects
onto the GPS map with a subset of APRS color icons, so the
operator at least can see what is around him...

I like it when hams are part of the picture, not just
transmitting in the blind.
I assume you had your contact frequency in your beacon.
(grin)...

Yes it does...I used the plotted locations received along with occasional monitoring of the activity on the frequency to guage the area coverage. Only ran through a few spots with low or no coverage.

Thanks Bob..

Thanks Don,
My apologies to all for the vague-ish post,
Perhaps I am comparing apples with oranges as I was comparing a Kenwood D700 with a "always on" external receiver antenna now changed to the d700 plus nuvi 350 and a different external receiver antenna. (GA 27C generic)
I could get a fix within 30 seconds before adding the Nuvi and a different external receiver antenna.
I thought this was because the GPS receiver antenna was "hot" all the time and only needed a warm start.
Now it takes 3-4 minutes with or without the receiver antenna attached to the Nuvi.
Maybe also the differences is between the the d700 and the Nuvi to resolve a fix.
Or maybe change to a genuine Garmin GA27C?

Regards
Glenn , vk1nut AKA "NUTTERS"

>or does Garmin believe that the public can't handle degrees...?

Bob, Garmin builds "horses for courses" and the Nuvis are pretty tightly targeted to "On the Road" market, i.e. cars. I think the 500/550 series is the only exception to this, waterproof and split for marine use as well. Maybe that one would allow you to view degrees, but for the typical "car driver"...degrees could just confuse things.

The 350 manual just shows directions as a choice of "N S E W" type information.

7937. APRS and YOUR hamfest

Yahoo group: APRS (2007 — 2010)
Date: 2010-08-20 13:35:45 UTC
From: Robert Bruninga
Topic: 7937 Message: 7937

Is your HAMFEST on APRS?

Just saw an Email announcing VA Beach Hamfest.
I went to the site, and it has little useful info (that I can find).
SO I wrote them this email (Which also applies to YOUR local hamfest too):

Your web page has nothing to offer the hundreds of APRS mobiles in the area:

1) Check http://map.findu.com/hfest* and no one is putting out a VaBeach hamfest ICON or bulletin to advertise the event on the front panel of all APRS radios in the Tidewater area... See how on www.aprs.org/hamfest.html

2) There is no link on your web page to an APRS map of the area so people can SEE the event and all APRS mobiles there. See how easy it is:
http://aprs.fi/?addr=va%20beach&mt=roadmap&z=11&timerange=3600

3) Your web page has no talk in freq.

4) No one is putting out an HFEST21VB object for this hamfest so that all mobiles in the region are alerted to the Hamfest...

5) The HFEST21VB object on APRS should have talkin freq so that mobiles with APRS radios can AUTO-TUNE to that freq/tone with the push of a button

6) No indication that talk-in operators will have APRS map display (or the above live intenet acccess) so they can see approaching (lost) mobiles.

7) No indication that talk-in operators will be monitoring APRS for incoming messages, etc...

8) Basically, no indication that VA Beach hamfest is in the 21st centry, other than a nice web page but without any reference to the technologies we use in the 21st century and ham radio.

I was pleased to see that map.findu.com/HFEST* shows three hamtests. But none of them include the TALK-IN frequency in the correct APRS format so that those with APRS radios can auto-tune to them. Format requires that FFF.FFFMHz Tnnn must be the first 10 or 15 bytes in the comment.

Hamfests are a place where APRS can have true value to not only the mobiles going there, but also the Talkin and organizers. But someone has to do the legwork to make sure it is in place and advertised. KUDOS to Huntsville and Danville Ill!

From: Don
Topic: 7924 Message: 7939

What you were using before (I'm willing to bet) was a combination receiver and antenna. Not JUST an external antenna. It was always on--both the antenna and the receiver. It was like having the Nuvi (receiver) and GA27C (antenna) BOTH always on.

I think the problem is that you are getting confused between the "hockey puck" type receiver/antenna combination units and the "hockey puck" type of external antenna only. These two types of units can look identical, but they are very different. One has a built in receiver, one does not. Don't feel bad, a lot of people get these two different types of devices confused, and the GPS manufacturers and retailers don't do a lot to dispel the confusion.

Again, if you want to get an external receiver and antenna combination, and feed the output from that to the Nuvi, so that you are using the Nuvi as ONLY a display unit (that is, not using the GPS receiver or antenna that are built into the Nuvi) then that might do what you want. I am not certain.

Spending all the money for a Nuvi, just to use it as a display unit, though, seems quite a waste to me. I would simply use the Nuvi and accept that it takes a couple of minutes for it to get a fix.

>

It won't work anyway. The external connection on the Nuvi is for an antenna only, not an entire GPS. You could, given the right TNC, hook a full GPS to the TNC for input and the waypoint output to a Nuvi, but that would count in my book as a bit extreme.

The only time I've had to wait for my Nuvi 350 to get a fix was when I powered up in underground parking garages in Spain and came to the surface after it had decided to do a cold start. And then I discovered that the rental's windshield must have had a metallic coating because if I undocked the Nuvi and held it out the window, it would lock on in seconds. When bringing it back inside, I could watch the satellite signals drop, but the fix would hold.

Date: 2010-08-28 22:28:07 UTC
From: k6rpt
Topic: 7944 Message: 7944

California Near Space Project (CNSP) is preparing to launch a high altitude balloon into the stratosphere on Monday August 30, 2010 at 5:00 a.m.

The launch will take place at 4954 Almaden Expressway - San Jose, CA 95118 (37.25945 -121.87479)

The weather balloon will be filled with a 137 cubic feet of helium to a diameter of 6.4 feet and will ascend around 730 feet per minute. When the balloon reaches its maximum altitude it will expand to a diameter of 42 feet and then burst.

The flight can be tracked live on the internet, at http://www.CaliforniaNearSpaceProject.com and selecting "track the flight."

7945. Bricked Motorola Oncore VP

Yahoo group: APRS (2007 — 2010)
Date: 2010-08-29 00:08:48 UTC
From: Al Waschka
Topic: 7944 Message: 7945

This is sorta OT, but maybe it is close enough; I know a lot of folks use the Oncore series receivers for APRS. I was tryng to troubleshoot a problem with an Oncore unit that I built up and use to drive a chartplotter with NMEA. Thinking maybe the plotter wanted to see a Loran format, I sent the command to the Oncore to switch it from the Motorola binary protocol to Loran emulation, "@@Ci 2". Now it won't do anything - dead as a hammer. I tried sending commands in Binary mode with no response. I removed power and the backup battery hoping it would reset to defaults, but after 30 minutes or more, still no response. According to the command protocol, Loran emulation runs at 1200 baud so I opened Hyperterm and set it for 1200-n-1 no flow control and sent the NMEA command $PMOTG,FOR,0<CR><LF> but still no response. Has anyone done anything like this, and is there a recovery?

Thanks,

Al

7946. Re: [APRS] Bricked Motorola Oncore VP (Fixed)

Yahoo group: APRS (2007 — 2010)
Date: 2010-08-29 04:23:59 UTC
From: Al Waschka
Topic: 7944 Message: 7946

Apparently LORAN emulation mode survives the loss of power and backup power. While in LORAN mode the serial port is set at 1200-N-8-1, as I knew. But I found a reference on the TAPR site that said the commands in LORAN mode are BIN for Motorola and NMEA for NMEA-0183. After being powered off for 4 hours with the backup battery removed, the unit was still in LORAN mode. Using Hyperterm set at 1200-N-8-1 and typing BIN the unit recovered to Motorola binary mode. This is unusual because I thought (and the documentation says) that without a backup battery the unit defaults to Motorola binary mode on loss of power.

7947. Observations from a day on HF APRS

Yahoo group: APRS (2007 — 2010)
Date: 2010-08-29 13:45:04 UTC
From: Wayne
Topic: 7947 Message: 7947

On Saturday, Aug. 28, from 7:00AM to 7:00PM I ran my HF APRS station. During that time I made note of all the stations that showed up by RF although I was connected to the Internet. Also from time to tine I monitored the frequency with the volume turned up. My equipment is a 30M dipole N/S at 30 feet, an IC-746 @ 50W, and Kam-XL.

Stations heard which were Igated by me.

TG9AFX N1RCW W1NP N4MAK K5RAV K4AG KM5HG
AB9FT K1CKK W4VAB W1JMC W81LW

Stations I did not hear that Igated me.

KB8UVN KJ4ERJ

Stations that Igated me that I heard.

W8ILW W1JMC W4VAB

The distance to the stations heard ranged from 190 to over 1300 miles. No stations heard were west of the Rocky Mountains. The strongest stations seemed to be north and south, which are off the ends of the dipole. Through out the day I heard one or more stations, which I could not decode with real bad sounding packets. I also heard one strong station with good audio that was a little off frequency that I could not decode. I did not hear any stations running PSK63 .

My only conclusions are:
It's all about propagation and band conditions.
There are not many folks running HF APRS.
If you are transmitting a beacon and no one is Igating you something is wrong.

Feel free to comment on any of this.

73 Wayne ☐ WA5LUY

> The distance to the stations heard ranged from 190 to over 1300 miles. No stations heard were west of the Rocky Mountains. The strongest stations seemed to be north and south, which are off the ends of the dipole. Through out the day I heard one or more stations, which I could not decode with real bad sounding packets. I also heard one strong station with good audio that was a little off frequency that I could not decode. I did not hear any stations running PSK63 .

7949. Travelling in Germany

Yahoo group: APRS (2007 — 2010)
Date: 2010-08-29 18:28:01 UTC
From: jmsmn2008
Topic: 7949 Message: 7949

I am using my D710A/AvMap G5 navigator while on vacation in Germany.
Why wont my APRS positioning info show up on APRS.FI? All settings are correct. My grid coordinates are correct. BCON & GPS (flashing). I'm
receiving hit's from stations in and around France, Luxemburg and Germany continuosly. When I enter my call sign, my old coordinates appear in Texas over 2 months ago. Any idea what I may have done /or doing wrong? Thanks

7950. Re: [APRS] Travelling in Germany

Hi

If you had put your call sign here, i would have checked your path from
you last beacon in Texas to see how that would fit in Germany

But have to give a few general comments. First you are on 144.800
right ?
Then do you have you path if mobile set to wide1-1,wide2-2 or similar.

When looking at APRS.fi do you se other stations around the location
where you are... Maybe a hint on where you currently are might help. You
might be in an area where there are a long way to an igate.

Hello
My call sign is KB3SQH (-14)
My aprs freq is 144.800; and yes I do see up to date/active stations around my location: My grid coordinates match up precisely with the local Rathaus(city hall) location info..MY MENU Settings are
MENU 611- Method=auto, Initial=2min, DecayA=on, Propor=on
612- Type= New-N, Wide1-1=on, Hops=2, Path=Wide1-1 Wide2-1
613- Network= APRS/altnet....614-off/ 77.0Hz
615- off, 616=off, 617=28sec, 618&619=off, 620=on
626- Display=km/h,km..m,mm..'C..
627- dd, mm.mm' 630 smart1 631 smart2=28degree,26, 30sec
AUX 518- Speed 1200bps...519- 9600bp...528- 9600bps
REPEA401- on.. 402-off. 403-cross band. 404-off. 405 rptr id
All appears to be set correctly, but I'm not showing up on APRS.FI
and I do not think local stations see my info. D710 shows aprs12//bcon gps(flashing).
Thanks

Hi

looking at you setting. At the first view all seems ok, but just thinking. you have Auto repeater offset on... I am not sure what frequency range are repeater in US... But could it be that spacing are on and when you tx your frequency are somewhere else... Go to the APRS VFO side and push PTT, check that display when TX still show 144.800

Do you ever get "my becon" on screen. Try to send a messaged (for your self or me for that matter OZ1BZJ-3 and see if you get "my messaged"

Also let me know you location in Germany (City) and i can check if i can find an Igate around there.

Also i need to ask... You squelch are not open right... many users of THD710 have tried that no becon was send because the radio believe that channel are busy because the squelch was wide open with volumen down or voice alert on you might not notice.

7953. APRS and Part 97 question

Yahoo group: APRS (2007 — 2010)
Date: 2010-08-30 12:43:35 UTC
From: kc0rey
Topic: 7953 Message: 7953

I saw a want ad where a very new Ham was wanting to purchase APRS equipment to put on his school's buses (I am assuming College, so that the students (Non-Hams) can track themselves as they ride around campus.

Is something like that legal?

Its perfectly legal as long as he is doing it as a hobby or a public service and has not been requested to do it on behalf of his employer.

The question was phrased in a way that suggest the Students were the operators, not the bus operator. You may infer from the question that somebody wants to throw trackers on a publicly owned school bus and operate under the auspices of a public agency (which in and of itself may or may not be permissible) but we don't really know that to be the case. I think that there is not quite enough information given to determine whether the act is permissible. There is nothing in the law that requires a licensed amateur to be aboard the bus, as long as they are the "Control Operator" within the meaning of the law.

So you're implying that it's perfectly legal for me to install a tracker in my son's car (who is not a licensed operator)?

If I do that, who is the control operator? What are the means to shut down the station if it malfunctions?

Due my lack of information, I copied the Ad and will paste it after this sentence, hopefully it will clarify things a little:

"I am looking for 2m or 70cm handheld radios and other cheap equipment that could be used with a tracking project I am working on at the University of Arizona. My friends and I in the IEEE student branch are working on a project to add tracking to a few of the campus busses in order to allow students to see where they are on a custom website. The site will display a campus map with moving bus icons and the bus routes. Right now I need to get some cheap equipment to build a demo unit that I can present to the transportation and engineering departments to gain support and hopefully funding for this system."

An argument can be made here that we are talking about an auxiliary station, which does qualify for automatic control. I can buy that, however if that is the case, the station must have some means to ensure that it does not cause harmful communications. A timeout timer would probably suffice.

Personally, in this situation, I would not put my callsign on it.

Since the ad identifies the need for radios as "2 meter" or "70 CM" as opposed to VHF or UHF, I think its clear they intend to operate on the ham bands. If they have any class license, they can do this lawfully. They are doing what the Amateur Radio Service is supposed to do; furthering education about radio communication and electronics by way of experimentation. Colleges use APRS for proof of concept experiments all the time. Bob Bruninga works for a college (The canoe club trade school)

You may lawfully install an APRS tracker on your Son's car, as long as it is not done covertly. You are the Control Operator, and are legally responsible for shutting the device down if it becomes necessary. There is no legal requirement that you do this by remote control, or any other specific requirement for how you must accomplish this. Dogs and high altitude balloons carry APRS trackers perfectly legally, and the method they generally use to ensure runaway operation is to have the on-board battery die. None of my dogs have a Ham radio license, and I am not sure that a balloon could prove its legal residency or citizenship either.

The APRS wiki has a very informative article on the meaning of "Control Operator" within the meaning of the law, and I urge people to take a look at it. The retired enforcement Kahuna for FCC, Riley Hollingsworth, was asked questions about this and peripheral issues on many occasions, many times from people who took the position that APRS was intrinsically illegal. In short, he responded by saying "quit playing lawyer-ball and do the right thing with the technology" He was satisfied that we are doing precisely that.

Part 97 requires that every station have a control operator. How you implement that in the case of an APRS station is ultimately up to the individual who puts their callsign on it. The control operator is ultimately responsible for the operation of his or her equipment. If you choose to allow it, so be it. That, in fact, was the basis of what Riley said.

In the case of putting ARPS gear on college transportation so that the students could track the bus, I certainly would not do it. From what it sounds like, they are looking for a proof of concept, which can be done very simply by tracking APRS equipped vehicles on APRS.FI. Using amateur frequencies to track vehicles is NOT an appropriate use, as it can easily be done on commercial frequencies.

Since the ad identifies the need for radios as "2 meter" or "70 CM" as opposed to VHF or UHF, I think its clear they intend to operate on the ham bands. If they have any class license, they can do this lawfully. They are doing what the Amateur Radio Service is supposed to do; furthering education about radio communication and electronics by way of experimentation. Colleges use APRS for proof of concept experiments all the time. Bob Bruninga works for a college (The canoe club trade school)

You may lawfully install an APRS tracker on your Son's car, as long as it is not done covertly. You are the Control Operator, and are legally responsible for shutting the device down if it becomes necessary. There is no legal requirement that you do this by remote control, or any other specific requirement for how you must accomplish this. Dogs and high altitude balloons carry APRS trackers perfectly legally, and the method they generally use to ensure runaway operation is to have the on-board battery die. None of my dogs have a Ham radio license, and I am not sure that a balloon could prove its legal residency or citizenship either.

The APRS wiki has a very informative article on the meaning of "Control Operator" within the meaning of the law, and I urge people to take a look at it. The retired enforcement Kahuna for FCC, Riley Hollingsworth, was asked questions about this and peripheral issues on many occasions, many times from people who took the position that APRS was intrinsically illegal. In short, he responded by saying "quit playing lawyer-ball and do the right thing with the technology" He was satisfied that we are doing precisely that.

An argument can be made here that we are talking about an auxiliary station, which does qualify for automatic control. I can buy that, however if that is the case, the station must have some means to ensure that it does not cause harmful communications. A timeout timer would probably suffice.

Personally, in this situation, I would not put my callsign on it.

Specifically, this type of operation is prohibited by §97.113(a)(5), which states: "No amateur station shall transmit...Communications, on a regular basis, which could reasonably be furnished alternatively through other radio services."

Mike
WM4B

On Mon, Aug 30, 2010 at 11:46 AM, mwbesemer@... wrote:

Part 97 requires that every station have a control operator. How you implement that in the case of an APRS station is ultimately up to the individual who puts their callsign on it. The control operator is ultimately responsible for the operation of his or her equipment. If you choose to allow it, so be it. That, in fact, was the basis of what Riley said.

In the case of putting ARPS gear on college transportation so that the students could track the bus, I certainly would not do it. From what it sounds like, they are looking for a proof of concept, which can be done very simply by tracking APRS equipped vehicles on APRS.FI. Using amateur frequencies to track vehicles is NOT an appropriate use, as it can easily be done on commercial frequencies.

Which radio service besides the ARS would you suggest for a digital tracking transmitter? These are engineering students studying engineering in College, a bona fide, legitimate use of the ARS. Would you make the case that the Naval Academy is violating part 97 when they use APRS for buoys, instead of say,.....some other radio service that permits this type of emission? Its also clear that this is intended to run strictly as a demonstration, and a proof of concept, not on a "regular basis". I think you are massively over-reading the statute.

my only suggested request would be that if this is taken under that it not be conducted on the national frequency of 144.39. Make sure you don't clog the system for other users.

we had a gentleman doing proof of concept at Cornell University for entimology studies with remote aircraft. It started with ARS frequencies, we had to ask him nicely to pick an unused frequency and stop jamming the national network every 20 seconds.

He kindly moved off to another frequency, and came up with a very useful tool.

Subject: Re: [APRS] APRS and Part 97 question

Which radio service besides the ARS would you suggest for a digital tracking transmitter? These are engineering students studying engineering in College, a bona fide, legitimate use of the ARS. Would you make the case that the Naval Academy is violating part 97 when they use APRS for buoys, instead of say,.....some other radio service that permits this type of emission? Its also clear that this is intended to run strictly as a demonstration, and a proof of concept, not on a "regular basis". I think you are massively over-reading the statute.

Topic: 7953 Message: 7970

Hello, I am KF7IYJ and I was the person who posted the original ad looking for equipment. A member of QRZ pointed me toward this conversation and I hope to clear things up a bit.

First, I am a technician class ham operator, a member of the local ham club, and the new VP of the student IEEE group on campus. I started my involvement in ham radio specifically for my interest in packet radio and the use of it in weather balloon tracking and telemetry. Recently, I became the new VP of IEEE and I am looking for projects for our members to work on that both introduce them to ham radio and provide the public a glimpse into the world of both our IEEE group and ham radio. On campus, we have a network of buses that don't really have a schedule, they just run their routes. At times, people might have to wait 15 min for the bus to arrive. I thought using APRS technology to track the buses and give the U of A community a site to see their location would be a really interesting way to use the technology. I was planning on having a page on the website that explained how the entire system worked, provided the source code to the site, and encouraged people to visit an IEEE and/or K7UAZ (the ham club)to learn more if they were interested.

Now, how I planned to implement this. First of all, I was planning on setting up a single bus in order to demo the site and technology to both the transportation company and the engineering dept. The setup was going to be based on a 2m HT radio(low power mode), a TinyTrack4 with smartbeacon, and a cheap GPS module, all of which would be mounted in a labeled, clear box that would allow people to see the equipment but not touch. This would be placed in the windshield of the bus using suction cups. The broadcasts would be on the national APRS frequency so we at first could parse the data from the APRS-IS database. I would have my callsign in the broadcasts as well as a message along the lines of "UofA bus tracking project" or something similar to identify the unit. This means that I would be the station operator and I would assume responsibility for the unit. The only control anyone else would have would be to turn the unit on or off depending on when the bus was in service. Finally, as I said, this is a single unit only that will be used as a proof-of-concept. If I were to expand to more buses, I would evaluate different methods of broadcast; either a separate ham radio frequency, or use a different radio technology such as an ungoverned spectrum or the use of a business radio license.

Well, this is the project that I am working on. This is a student project that I am using to stir up community interest in ham radio and our IEEE group. This is in no way going to be used to make a profit and is not used for business use, just research into the feasibility of providing a free educational service to the community. Now I understand many of the concerns that have been raised. I do not indend to jam the APRS network and I will of course use best practices to avoid any and all interference with other peoples use of the network. I understand that this is a shared resource that needs to be allocated efficiently and if anyone thinks I should approach this different, please give me recommendations on how to approach this project in a different way, but please dont tell me it wont work without at least trying to help me find an alternate route.

I hope this clears up any misconceptions over the intent of this project. I look forward to any and all advice the ham radio community has to provide.

The following pertains to APRS use. An APRS station may be placed without a control operator physically present in "automatic" mode i.e. your kids car etc.

§ 97.221 Automatically controlled digital station.
(a) This rule section does not apply to an auxiliary station, a beacon station, a repeater station, an earth station, a space station, or a space telecommand station.
(b) A station may be automatically controlled while transmitting a RTTY or data emission on the 6 m or shorter wavelength bands, and on the 28.120□ 28.189 MHz, 24.925□24.930 MHz, 21.090□ 21.100 MHz, 18.105□18.110 MHz, 14.0950□ 14.0995 MHz, 14.1005□14.112 MHz, 10.140□ 10.150 MHz, 7.100□7.105 MHz, or 3.585□ 3.600 MHz segments.
(c) A station may be automatically controlled while transmitting a RTTY or data emission on any other frequency authorized for such emission types provided that:
(1) The station is responding to interrogation by a station under local or remote control; and
(2) No transmission from the automatically controlled station occupies a bandwidth of more than 500 Hz.
[60 FR 26001, May 16, 1995, as amended at 72 FR 3082, Jan. 24, 2007]ut a control operator under this rule in "automatic".

Hello Rob, let me cut thru the bullshit that collects on the groups.
First of all to answer the question about the rules, yes you allowed to do what you are seeking as long as it is not for a commercial purpose at all. This subject was beaten to death many times and Riley stepped in and made it clear for all of us a long time ago.
My advise would be to wire a relay so when the ignition is switched on so is the tracker. This eliminates any question of "automatic operation".
Second is to set the UNPROTO path to WIDE-2-1 @ 3min (Smart Beacons is ok)
MT Eldon has a digi on top of it but at times depending how close you are to the mountain you can get shaded.
If the area traveled is within the flagg area you could always use 144.370, place a home station on campus or at an actual home running UI-View, you can then feed the data to the IS and still have it available on the internet.

The Arizona Repeater Association handles the digipeater on that mountain, it has been a while since I have been in AZ but I believe the contact person is still Brian McCarthy N7TUQ.

Hmmm,

I am not so sure about that. Besides not being able to use digipeaters (store and forward devices) and limited to two watts, I think that 95.631 prohibits any tones other than CTCSS or DCS. I think I would want a ruling from the FCC on that. My understanding is that Garmin had to get a special waiver for the Astro (dog tracker) product line.

how does this section apply to an APRS station that is powered off and then powered on by an unlicensed ham? "(1) The station is responding to interrogation by a station under local or remote control; and...". when i power on my APRS station in our camper the radio automatically beacons it's location. it is not responding to an interrogation by another station under remote control. maybe i'm reading too much into this but if the radio auto-beacons upon power-up then that seems to be the equivalent of an unlicensed person initiating a transmission. not an issue if a control op is present but in this case no control op will be present. placement of the equipment does not seem to be the issue....turning the equipment on and off is. again, i may be over thinking this.

Thanks for the response. I was planning on having the radios turn on based on the engine status, usually the cig lighter ports are switched. I might provide a MIC-E or power switch for the driver in case the bus is being taken to the garage or something. Also, from ARPS.fi, it does look like someone is operating the iGate N7HND right in the middle of Tucson so I should be able to hit them with the HT on low power which will reduce the transmitting area. Finally, if I were to expand this beyond 1 or 2 units, I was planning on asking the ham club if I could just install a small antenna/receiver atop the engineering building or at another location. Since the entire campus has Wifi, all I need is a salvaged laptop and a HT unit jammed into a waterproof box to make my own iGate. I was also going to consult with the ham club at the next meeting on how to do a larger setup using ham radios or if I should use another spectrum.

Anyway, thanks for the response. When I get new information on my setup I will be sure to keep everyone updated.

P.S. Why does it take >15min for my responses to appear? Is there some sort of moderation que?

The ARRL/TAPR DCC (Digital Communication Conference) will be held

in the Portland, OR area on September 24 - 26.

----- Forwarded Message ----
From: Steven Bible <n7hpr@...>
To: tapr-announce@...; hpsdr@...enhpsdr.org
Sent: Mon, August 30, 2010 9:06:53 AM
Subject: [tapr-announce] DCC Early Registration Deadline September 1st

The September 1st deadline to register for the DCC and get the best room
rates is fast approaching.

The DCC activities planning are in the final stages:

- The DCC Proceedings is over 200 pages! See the list of papers below.
- The speakers schedule is being planned.
- Introductory talks.
- Banquet Speaker
- The Sunday Seminar on DSP Tools, Techniques, and Tricks presented by Rick
Muething, KN6KB (see below for abstract)
- Wonderful location at the Heathman Lodge, Vancouver, WA
(http://www.heathmanlodge.com)

If you have not attended the DCC, you are missing out on a lot of technical
fun. Papers, presentations, demos, meeting like minded people. It is a
great event. Ask anyone who has attended one!

To register for the DCC go to http://www.tapr.org/dcc. Hotel registration
information is also located there. Be sure to mention the DCC for the
discounted rate.

See you at the 2010 DCC!

73, DCC Planning Committee.

Sunday Seminar

DSP Tools, Techniques, and Tricks

Rick Muething, KN6KB

Time: Sunday Sept 26, 8 AM 12 Noon

Prerequisites: An interest in Digital Signal Processing. Some experience
in programming may be helpful. The only math you¹ll need is addition,
subtraction, multiplication and division and some idea of what a sine wave

is.

Goals: The goal of the workshop is to encourage those peripherally interested in DSP to take the next step to learn what DSP can do and try some DSP design and coding. Each attendee will get a handout CD which will include all slides with links to useful references. The CD will also include some basic Windows VB.NET examples of operational code along with some useful DSP tools (demo versions).

Sessions: Four sessions 45 min each with 15 minute breaks.

1) DSP Intro and Basics: what we are trying to do with DSP. Why is it better/different than analog. The cornerstone of DSP .the Fourier Transform and the FFT.

2) DSP Tools: What you need to see, interpret and understand signals. Basic waveform processing utilities. How do you setup a sound card to capture and play back audio with examples. How to design basic DSP Filters using common tools.

3) DSP Techniques: How do we use DSP to do those things needed in a radio. Mixing, Filtering, Modulation, Demodulation, FSK, PSK, Tone Detection, AGC etc

4) DSP Tricks: Tricks of the trade to make the impractical possible. Common and useful tricks to make significant reductions in computer demands, Single tone detectors, decimation, windowing, CIC Filters, IQ sampling.

No seminar or workshop can cover this topic completely in a few hours but this workshop should remove some of the mystery of DSP and motivate those to learn what can be done and get more involved.

Bio: Rick is a retired entrepreneur electrical engineer and has been a ham since 1962. After volunteering for the Winlink Development effort in 1998 he focused his efforts on programming and DSP. Rick was responsible for the SCAMP, WINMOR and V4 sound card protocols described in the DCC 2004, 2008 and 2010 proceedings along with several of the software components of the Winlink 2000 system.

Subject: Re: [APRS] APRS and Part 97 question

Which radio service besides the ARS would you suggest for a digital tracking transmitter? These are engineering students studying engineering in College, a bona fide, legitimate use of the ARS. Would you make the case that the Naval Academy is violating part 97 when they use APRS for buoys, instead of say,.....some other radio service that permits this type of emission? Its also clear that this is intended to run strictly as a demonstration, and a proof of concept, not on a "regular basis". I think you are massively over-reading the statute.

Specifically, this type of operation is prohibited by §97.113(a)(5),
which states: "No amateur station shall transmit...Communications, on a
regular basis, which could reasonably be furnished
alternatively through other radio services."

Hello Michael

Well I turned the squelch to about 10 o'clock/ turned up the volume on aprs freq a notch or two. Reset bcon (turning off-on). Send you three (same Hello) messages. I then go inside my apartment; check aprs.fi and BINGO, I am FINALLY showing up after nearly 9 days of trouble shooting. I think you suggestion of adjusting the squelch/volume was the key; as MY POSITION started routinely popping up on my display. THANK YOU for you idea's. I will now open the aprs reporting range to 2500-3000miles; Perhaps you will get my info on your radio's LIST. 73 Melek kb3sqh

I have one of those, and they work GREAT.

Just my opinion of course.

I'd still caution the use of the national frequency if you go past the 1st bus. The idea of a separate frequency and an IGate for that frequency sounds feasible though.

You may want to include your e-mail or phone number in the comment beacon so that if someone notices a problem with the station they know how to contact you.

[quote http://aprs.org/localinfo.html]
TRACKERS ARE TWO-WAY-TOO: . Even those transmit-only APRS trackers should be configured to facilitate two-way human communications. . The RECEIVER should be tuned to a desired voice communication calling channel with this frequency information placed into the beacon text of the tracker. . This way, all who see the tracker can also establish contact with the operator. . Often this can simply be the Voice Alert frequency.
[/quote]

Just food for though. I'm curious as to how this will work out for you as a recruitment tool. I'm the Staff advisor for Cornell Amateur Radio Club W2CXM and am looking for idea's for getting the club back up and running as it has dwindled dangerously close to extinction in the last 2 years.

What system is used to track cargo vessels traversing the ocean? It must be satellite-based, but they show up on APRS.fi.

Locally, our school busses are tracked and the dispatcher can pinpoint the bus's position at any time as well as play back the bus route to see if the driver skipped any stops or deviated from the route in any way. I suspect (but don't know for sure) that it's tied to their radio systems, which are VHF.

There are many ways out there to track many vehicles via GPS. Nations Tractor Trailer companies use it to track shipments and ensure drivers compliance with DOT Rules and Regulations. I'm not sure how those work, but I know that they're out there.

Many Law Enforcement agencies have started using AVL (Automatic Vehicle Locate) systems to ensure that when an emergency call arrives, then the closest car is dispatched to it. These are done utilizing GPS Receivers hooked to Mobile Data Terminals and are transmitted over VPN's to the dispatch center.

My agency utilizes Garmin GPS "Hockey Pucks" for this.

There are MANY other options out there that don't require use of the Ham Bands, or even RF at all for that matter.

It's my understanding that Robbie is looking for an engineering project, and a way to increase attention to the local Ham Club on the campus. If utilizing APRS for this is a valid and legal way to do it as a proof of concept for utilizing RF for this tracking, then I wish him luck.

I agree with the proof-of-concept portion of the project, but it should not go beyond that simply because there ARE other means to accomplish the task. §97.113(a)(5) clearly prohibits "Communications, on a regular basis, which could reasonably be furnished alternatively through other radio services.", which is EXACTLY the case here.

In effect, it would be using amateur frequencies to provide a commercial service to a commercial entity... which is what all the fuss about amateurs who worked for hospitals, etc participating in drills was all about.

Frankly, I don't see much need for proof of concept... the concept gets proven every day when I drive to work and leave a little trail of dots behind. I understand that the administration needs to be shown how it works (and that possibly a grade is involved) but it's an awfully basic project.

From: CaptALord@aol.com
Topic: 7953 Message: 7989

I agree that they should migrate to another radio system after testing on APRS. Although we may not require proof that APRS is a reasonably mature technology, these guys need to "sell" the idea to their Institution in a clear and graphical way. (We have enough trouble even getting Hams to understand APRS, let alone College Bureaucrats!) APRS is an off the shelf means of demonstrating this. For long term use, I suggest that they consider the 900 MHZ, license free band at 1 Watt power, with each bus acting as a tracker and a digi. Deep ocean trackers use INMARSAT satellites for a tracking data link. In port, the 900 mhz anti-collision systems have also been ported to the APRS-IS. Commercial vehicle trackers are generally cellular based, but satellite systems also exist for more critical applications.

On the face of it, it could be a fairly simple project, but to turn it into a useful information system could be a real challenge. You could for instance, use a receiver and display at bus stops and on board busses to provide updates on the ETA of a bus to specific locations, advise of traffic problems, security and weather warnings, etc., through an APRS (style) link. The tendency is to think of this type of system as a CAD (Computer Assisted Dispatch) system, rather then a semiautomatic public information system. I think their idea is awesome, and we should help, not short-sheet, them.

7990. Re: APRS and Part 97 question

Yahoo group: APRS (2007 — 2010)
Date: 2010-08-31 17:09:02 UTC
From: thedeepfriedboot
Topic: 7953 Message: 7990

Ill definitely look into the 900Mhz system. I was intending on moving to a different, less crowded platform if we expanded the system. The reason I want to work with TinyTracks is because they will work with whatever radio we plug into them, just need to make a new cables. I would also then use my own receiver on campus to guarantee better reliability and access to the data. All I would need is an old laptop and a spare radio in a weatherproof case, and I have plenty of old junk laptops sitting around.

Now, on to the 2nd paragraph. As mentioned, the idea of the system is not to prove that APRS still works, its to investigate the integration of APRS with custom written software that will prove its usefulness beyond ham operators alone. Think of what I am doing as a science fair demo. I want to built a easy to understand educational tool to demonstrate the usefulness of ham radio, a technology that is relatively unknown to most of the community. Instead of just talking to people though, I want to show them how it works and let them see it working real time. Lectures and slides boring to most people, you cannot attract that many people at a science fair without providing a demonstration that blows up a few thing , and the same applies to ham radio (minus the blowing up of stuff, hopefully :)).

That being said, I also want to use this as a learning tool to the IEEE students and hopefully attract new members who are interested in projects such as this. Many of them do not fully understand ham radio and I want to introduce them to it as well. I want them to help me build the system, I want them to research other uses for this system, and I hope they will discover other uses for the technology beyond what I am starting with here. What will be a small tracking system in the beginning will hopefully encourage more innovation into both the use of ham radio and the design of public interactive systems. Yes, this is a simple use of the APRS system that some of you dont think is worth the time, but in order to learn, you have to start simple and let people become comfortable with the material before moving on.

Although we may not require proof that APRS is a reasonably mature technology, these guys need to "sell" the idea to their Institution in a clear and graphical way. (We have enough trouble even getting Hams to understand APRS, let alone College Bureaucrats!) APRS is an off the shelf means of demonstrating this. For long term use, I suggest that they consider the 900 MHZ, license free band at 1 Watt power, with each bus acting as a tracker and a digi. Deep ocean trackers use INMARSAT satellites for a tracking data link. In port, the 900 mhz anti-collision systems have also been ported to the APRS-IS. Commercial vehicle trackers are generally cellular based, but satellite systems also exist for more critical applications.

> On the face of it, it could be a fairly simple project, but to turn it into a useful information system could be a real challenge. You could for instance, use a receiver and display at bus stops and on board busses to provide updates on the ETA of a bus to specific locations, advise of traffic problems, security and weather warnings, etc., through an APRS (style) link. The tendency is to think of this type of system as a CAD (Computer Assisted

Dispatch) system, rather then a semiautomatic public information system. I think their idea is awesome, and we should help, not short-sheet, them.

7991. In One Database but Not the Other?

Yahoo group: APRS (2007 — 2010)
Date: 2010-08-31 17:11:07 UTC
From: Don
Topic: 7991 Message: 7991

New to APRS. Used my tracker for the first time this weekend.

When I got to aprs.fi and search for "w0dlm-2" I see my track. When I look in findu.com though I am not there. I thought these systems all shared data so that if you were in one you'd be in the other. Not true?

Icon's Moving on a screen is a great way to get public interest.

My County club uses APRS in many public service events to illustrate rest stops, and leading, trailing, and mechanical vehicles on a map. The event organizers LOVE this, and it gives folks something interesting to watch, and can help them keep track of how the event is progressing.

What program are you planning to use for display?

All there is to know about APRS (hihi) written by the man who developed it.

7993. Re: APRS and Part 97 question

Yahoo group: APRS (2007 — 2010)
Date: 2010-08-31 17:56:06 UTC
From: thedeepfriedboot
Topic: 7953 Message: 7993

We actually want to build a custom website for the public to use. One of the people helping me is working on a site that will pull APRS-IS data, filter out everything but our equipment, and then display the buses on a campus map with the route colors. We are going to make the site mobile/standard so people can pull up the tracking list on their mobile phones or computers. We decided that using a site would be simplest since most people would be unwilling to get APRS software and setting up hardware at the bus stops would be expensive. Therefore, all we have to do is put signs up at the stops and on the buses directing them to the site. Eventually we want to add features that will tell message people when their bus is about to arrive. We plan on documenting the code and making it available as soon as it matures enough to be releasable.

Quoting Don <d.l.million@...>:

> When I got to aprs.fi and search for "w0dlm-2" I see my track. When
> I look in findu.com though I am not there.

Are you sure your tracker knows where you are?

Findu.com shows your last position here:

http://www.findu.com/cgi-bin/find.cgi?call=w0dlm-2

APRS.fi shows your last position here:

http://aprs.fi/?call=w0dlm-2

Note that they are not the same. APRS.fi filtered out your last
position report because the position was encoded incorrectly. Findu
didn't filter it and puts you somewhere in Algeria.

Check your GPS and your tracker settings to make sure it's beaconing
your correct lat/lon.

Bob...

Hi Melek

Good to see you on the map in Germany. You beacon did get through to APRS-IS with no problem. So now you are no longer in the eastern Dallas (The a direction i never have been to during my business trips to Dallas). Now you show up very fine just south of Mannheim. You 3 messaged did make it to my UI-view station at home..

I am pretty sure that the squelch did the trix. The volumen make no differences. If the modem in the Kenwood see the squelch open because it is set to low it is so very polite and do no tx until it see a free channel ie. the squelch are closed. assuming you had the radio with you on a flight. The handling alone might very well have turned down the squelch by accident. As mentioned seen several time here. Ofcause the reason might as well be that the radio are facing more background noise with the setup you are running here on this side of the Atlantic.

Enjoy you stay in Germany... i hope you like it..

Okay... I wonder if the last position report before I shut it off got garbled somehow, and aprs.fi filtered that out while findu did not. I can assure you that I wasn't in Algeria over the weekend!

I note that when I click on "Raw APRS Data" on findu it says there is none for me.

7997. More observations about HF APRS

Yahoo group: APRS (2007 — 2010)
Date: 2010-08-31 17:10:47 UTC
From: Josh Housey
Topic: 7997 Message: 7997

Hi Wayne/All,

What you heard/observed was probably relatively similar here. You were "booming" in here, very constant copy throughout that day.. Probably more so, then many other station...

I did not hear W1NP, W8LIW and N4MAK. However, I don't really understand that because my antenna "favors" NW with W1NP. Also, my angle of radiation of my antenna seems to also slightly "favor" short skip stations and should hear W8LIW. Long-skip is a very "hit-in miss" with K4AG (more nighttime then daytime at all) and K5RAV. Also when I also figure it, my SW radiation pattern and to some degree other "S" patterns are poor. Otherwise, my other "better" end is NW and there is absolutely no one there. There use to be VE4GLS which was an excellent short-skip and constant station, but don't hear him anymore... Which brings to your and mine fair assumption that there aren't enough stations and there are many others that are receiving and Igatting. Also, propagation/band conditions have "much" to play with it. I figure 30 to be like "40" during the day and "sometimes" is 20m in my opinion (yet I don't see it much).

As for stations west of the Rocky Mountains, there is VE7TXP who is "rarely" heard here. I don't know if W7CCY from Washington is still on, haven't heard him in a long time. Otherwise, the other consistant station on seeing from Internet is W6OTH near San Francisco. "Sometimes", there is N7UV, but I haven't also heard him in an extremely long time as well. It is nice to see some Latin America activity and I have copied TG9AFX a few times as well. The only other station I seen from the area was an XE1CDL??? and there use to be a 9Z4ZP heard quite a bit, but that was a long time ago... Also, from time to time, you should hear ZS1CP?-9 maritime mobile in the Pacific along South America. I have also heard him as well and know he is on because the "powerhouse" station W1JMC keeps reporting him...

Enough said...

> With only a provided time slot of about 10 minutes, I would
> like to familiarize our local EOC members with the basic but
> essential features of APRS useable in an EOC environment.

I prepared this talk to our local EOC group. But it is more of a how-to-set-up your D700 radio, because our EOC purchased about a dozen D700 radios for all amateur radio support of county communications, and then none of them were being used for APRS, because no one showed them the power of the radio for supporing all the features of APRS...

See the second link down on this page www.aprs.org

If no one in your area has D700's, then my overall PPT is about 4 lines below the USA map by OH7LZB "APRS by Bob".. But it will need a lot of trimming to get down to 10 minutes...

Bob, Wb4APR

8000. APRS radio comments FT-350 or Kenwood 710?

Yahoo group: APRS (2007 — 2010)
Date: 2010-09-05 04:31:47 UTC
From: dbelb
Topic: 8000 Message: 8000

- Recently attended a presentation by Bob Bruninga and want to get into APRS messaging.
- Although I am leaning towards the Kenwood 710, before jumping in I wanted to see if others in the group had any thoughts pro or con on the Kenwood 710 or the FT-350.
- I want to send my stations APRS tracking signals, digipeat as needed in certain areas, do APRS messaging and anything else that I should be looking at doing with APRS. Currently run UIView32 and am looking to expand my use of APRS.
- Any thoughts or comments on the radios, or what I should look at doing next with APRS would be much appreciated. Thanks.

The D710 has a TNC that is accessible by external software. AFAIK the FTM-350 doesn't.

By the way you should take a look at APRSISCE http://groups.yahoo.com/group/aprsisce/ which is in current active development unlike UIView.

From: Bela Markus
Topic: 8002 Message: 8002

Hi,

in Section 15 of APRS protocol Specification (1.0.1) it is written:

"MSG_CNT is the number of messages transmitted"

I do not find definition what messages in this context means and how is
it calculated?

Thanks for clarification,

B?la, HA5DI

8003. Re: [APRS] MSG_CNT specs?

From: Lynn W. Deffenbaugh (Mr)
Topic: 8002 Message: 8003

According to my observations of active IGates, MSG_CNT is a count of the messages gated from -IS to RF for recently local stations. At least, that's what I've implemented it as in my APRSISCE/32 IGate software. I've also added a few counters to my software in addition to the two "currently defined".

Send a ?IGATE to KJ4ERJ-1 and you'll see what I mean (or check the raw packets at aprs.fi for KJ4ERJ-1.

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile and Win32

8004. For Sale: TinyTrak4 APRS Tracker with TT4 DK Adapter Kit and TinyTrak4D Display

Yahoo group: APRS (2007 — 2010)
Date: 2010-09-07 20:26:05 UTC
From: Mike Besemer (WM4B)
Topic: 8004 Message: 8004

TinyTrak4 with Case, TinyTrak4D Display and TT4 DK Adapter Kit:

TinyTrak4 takes the features of the popular Byonics TinyTrak3Plus and adds:

- DSP Packet Decoding - Using software DSP, the TinyTrak4 can not only decode 1200 baud packet, but also 9600 baud, and 300 baud packet, DTMF, and more. Since the decoding is not hardware based, new demodulation capabilities can be added to existing TinyTrak4s.

- Field Upgradeability - New firmware can be downloaded for free from the TinyTrak4 website and sent to the TinyTrak4 with a computer serial port and a F-F null modem adapter.

- Analog & Digital Telemetry - TinyTrak4 can read temperature, battery voltage, and other analog and digital sources.
- More powerful processor - TinyTrak4 has more processor speed, code space, RAM, and EEPROM than the TinyTrak3 to allow for more features.

Implemented Functionality:

- Field upgradeability
- TinyTrak3 features - Most all the TinyTrak3 functions have been translated to the TinyTrak4
- Send & receive APRS text messages (with optional display and keyboard)
- Smart Digipeater
- KISS TNC
- APRS tracker that can plot positions as waypoints on compatible GPS receivers
- Telemetry
- Weather station support
- Packet display Remote control
- UI TNC
- New! Send and receive APRS text messages with the AvMap Geosat 5. Get the latest AvMap firmware HERE. See Don's Video Demo

Scott Evans, VK7HSE has setup a TinyTrak4 Wiki at http://www.vk7hse.hobby-site.org/wiki/index.php/Main_Page.

Display is mounted in homebrew case. Includes all cables required to hook to FT-2800 and computer. Perfect for operation as an I-Gate with UI-View or similar software. Add a GPS to take it mobile and use it as an ARPS tracker.

See http://www.byonics.com/tinytrak4/ for full details.

Pictures uploaded in the 'Files' section of this group in the WM4B TT4 folder.

Cost to buy new is $101. I am asking $50 + $10 shipping PayPal is preferred

Contact me at mwbesemer (at) cox (dot) net if interested.

73,

Mike

Lynn

thanks for the reply. It is in fact number of packets gated, nothing to
do with messages. Nice, the other introduced counters are informative
and useful.

Over which time period counter is running, for 1 ghour, 30, mins, ???

I can only speak for my APRSISCE/32 client and observations on others,
but it seems to be since the Igate software has started execution and
increments forever. I've honestly not watched it closely, but
eventually I plan to capture the data and graph it on a per-station
basis in APRSISCE/32.

aprs101.pdf doesn't specify any interval on the MSG_CNT on page 77 (87
in the PDF). And the LOC_CNT does seem to be an instantaneous count
based on the definitions of "recent" and "local" to the generating software.

From: Bela Markus
Topic: 8002 Message: 8008

I checked not only 1.01 but later addendums at tapr.or and asked on
the aprssig tapr mailing list, but no answer. It means, that you can use
an algoritm you find best fitting. For msg_cnt lets say 1 hour seems to
be a good choise.

LOC_CNT can be implemented as number of different stations heard on any
of radio ports in last 30...60 minutes.

Ok, it is enough for now.

Thanks and regards

B?la, HA5DI

8009. Webcam and GPS working together in a Car - Step Further in APRS

Yahoo group: APRS (2007 — 2010)
Date: 2010-09-20 04:09:52 UTC
From: Gmail - Kevin, Natalia, Stacey & Rochelle
Topic: 8009 Message: 8009

Hi All,

I am trying out a little project and my Google searches are not coming up with what I really want.

This is what I want to do.

I have a webcam fitted to the dash of my car. I also have a GPS puck that plugs into my small netbook.

I want some way of having both come up in the same application.

Something like they have in Police cars, where you have live video and the speed, gps data etc.

If I can get this to happen I will then be looking at (in future) uploading (This will of course depend on Data traffic rates getting better)

But for the mean time I can save onto the computer and download or upload to home computer or Web site.

Has anyone seen anything along these lines within a workable price range?

Thanks

Kevin, ZL1KFM.

Hi,
Just thinking about this simplistically,you could rig up a small website on the netbook and grab code from the web which will make it possible to view the video stream by pointing the URL at Media Player, for example. If your netbook had 3G/4G connectivity, you could display Google earth, use your GPS for input and get a live KML file import - these are available. Perform a Google Search on APRS feed kml

Without a 3G/4G connection, you could load APRSPoint along with mappoint and use a 2M radio and a TNC to provide APRS input.

You could also us MS Mappoint directly, with GPS input and that would show you the route and you'd have the camera display in another window.

I don't know about having them show up in the same app, other than designing a local web app and getting feeds from the video camera as well as from an external APRS mapping site.

This is just my 2 cents. Please let us know the path you take.

Can the KAM Plus (V8.0) be user for APRS?
I would like to set it up as a APRS relay for my area.
If can be used dose anyone have a basic setup you could send me so I have a place to start my setup from.

Thanks
Roger

Try using programs called MiniCam and Xport.

http://www.curioustech.net

Minicam does the recording, and you can set the top and bottom text overlays to GPS information, your call sign, whatever you want, you can even interface it with your OBD2 port on your vehicle and get your RPM and other data from your vehicle. It may take a while to figure out the settings in Minicam however they are complicated on getting set just right.

Xport allows you to take the input on one com port (GPS in this case) and emulate it on several other virtual com ports.
So for instance you can take GPS input on Com 2 or 3, and ouput it on port 4 for Minicam, port 5 for UI-View or another APRS program, and even port 5 for something like Delorme Street Atlas or similar for Mapping and Directions.

I do not think this will work however unless your USB GPS mounts as a serial port. I know some Delorme USB models do not mount as a serial port and will not work.

I have fellow ham here in the area that uses this setup on a Panasonic Toughbook, with an AT&T 3G aircard and submits his APRS packets into the APRS-IS over the internet rather than radio.

8014. DCC Forum Schedule Announced for ARRL/TAPR Digital Communications Conference, Portland, OR September 24 - 26

Yahoo group: APRS (2007 — 2010)
Date: 2010-09-20 18:49:05 UTC
From: Mark Thompson
Topic: 8014 Message: 8014

The ARRL/TAPR DCC (Digital Communication Conference)
will be in Portland, OR on September 24 - 26.

TAPR is the national digital ham organization and the DCC is the annual
conference.

The DCC Forum Schedule has been published & is available at:
www.tapr.org/pdf/DCC_2010_Schedule2010-09-17.pdf

As you will see there is something for everyone at the DCC including Technical
Presentations & Papers

covering Digital Voice, Digital Amateur Television, Softwware Defined Radio &
Digital Data and also Introductory Presentations.

The Saturday night banquet speaker will be Dr. Nathan “Chip” Cohen, W1YW.
Yaesu has contributed a VX-8DR HT as a major banquet prize. There will be other
prizes as well.

More details about the banquet at: www.tapr.org/dcc#banquet

The Sunday morning Seminar will be conducted by Rick Muething, KN6KB and
will cover DSP Tools, Techniques, and Tricks.
More information about the Sunday seminar at: www.tapr.org/dcc#seminar

Complete information about the DCC is available at: www.tapr.org/dcc

We hope many of you can attend the DCC this year.

You can follow TAPR activities on Facebook & Twitter at
TAPR's Facebook Profile at: www.facebook.com/TAPRDigital &
TAPR'S Facebook Fan Page at: www.facebook.com/pages/TAPR/116614778354245
and on Twitter at: www.twitter.com/TAPRDigital

The Summer 2010 edition of the TAPR PSR Journal is now available at:
www.tapr.org/psr/psr112.pdf

This is the coolest thing I've seen all day! I was thinking about setting up something similar, using a linux package called "Motion". I was thinking it would just take a snapshot every 60 seconds or something then have it ftp the file somewhere. It wouldn't have gps and ODB-II integration though....

It could using KISS Mode, but you'd need a computer. V.8.2 would allow what Kantronics calls Advanced APRS.

Here is a link to Kantronics website with all the Version Info:

http://www.kantronics.com/legacy.html

<http://www.kantronics.com/legacy.html>If you get the idea you don't want to use a computer, I would be willing to pay a fair price for a TNC that would work in KISS Mode.

Justin,

Thank you for the info, this is indeed the thing I am looking for.

The only problem I now face after reading the web site is I have a 64Bit laptop and it says it won't work with this. I can confirm this as it came up with errors when trying to install and run.

To the question below about the USB GPS, it does show as a Serial port, I believe in my case it says com3, so should work.

Something for me to play with.

Regards

Kevin, ZL1KFM.

By Kam software are you refering to the HostMode software that Kantronics used to sell or are you talking about the Prom?

Version 7 will do anything you might want to do. there are some work arounds for setting it up as an APRS Digi though.

I am researching APRS. I would like to buy a portable GPS unit I can use both for navigation and to generate APRS data. Is there a list somewhere of GPS units that output NMEA data?

8023. Embedded linux machine for APRS

Yahoo group: APRS (2007 — 2010)
Date: 2010-09-27 21:24:48 UTC
From: Rahn Abbott
Topic: 8023 Message: 8023

Hello folks.

I am looking to start a project that may be way over my head. But I am looking to have a small receiver/transceiver connected to a TNC connected to a small embedded board that will operate as an I-gate. I have the TNC, I have the embedded board and I have the radio. What I do not have is an operating system for the embedded board.

I would like to find an operating system that is small, can be run on a Compact Flash card, and it will probably be Linux. A GUI is not really needed.
What comes to mind when you think of small embedded operating system?
What comes to mind when you think of a small program that would run as an I-gate?

My first thoughts were Xastir but I think that may be more program than what I really need. Basically it just needs to receive packets from the TNC and dump them to the internet.

The goal of this project is to have a small, low power consumption, stand alone digipeater site that will feed data back to the internet via wireless network.

Small enough to run on a battery being fed by a solar panel.

Another thing that maybe nice but not really needed would be a lightweight database gathering data from the TNC as well for statistical purposes. Might be nice, but would definitely be an add on later. First priority would be to get it up and running.

Thoughts, questions, comments?
Please.

Look into APRSISCE for Windows Mobile. It can run on a cell phone and
will eventually (hopefully) be able to run on an HP Journada. The
Journada doesn't have WiFi (at least I don't think it does), but nearly
any Windows Mobile cell phone should certainly not break your power budget.

BTW, how are you getting Internet access if the only power you have is
from solar?

Check out this project. A lot of the work has already been done. I've tinkered with this a little. I didn't have much success but I didn't try that hard either.

The jornada lynn can be made to go onto wifi is you use a Linksys
WPC-11 ver 3.0 16 bit pc card. I have 2 of those pc cards for my
nec mp-900c and my hp jornada 728. It works very well on wifi it even
allows me to run ministumbler also for network wifi sniffing.

I will be getting internet access from a wireless card running on the embedded board. Add an all weather flat panel antenna for the wireless and I can plug back into my house from a long way away. The longest 802.11B hop that I have made was just under 40 miles. And with packet loss at that range I would still have enough bandwidth to push packet frames to the internet.

I used to run a jornada using Ministumbler too. Worked pretty well. The APRSISCE program looks pretty cool but I don't think that's exactly what I am looking for.

The two projects mentioned that are for the WRT routers look like exactly what I am looking for. Now I have to figure out how to get one of them onto and running on a platform that is not a Router. That should be the easy part.

Thanks again.

A specialized version of the OpenTracker RT board used in this project that plugs directly into the WRT is still in the works. I've had the first prototype assembled and set up for months but haven't had time to work on it. I'm going to try to get back to that soon - now that GTRANS production is mostly straightened out I might actually get to it. It mostly needs an XMODEM bootloader so the firmware can be updated via the WRT.

Hi

one of my digi run on a asus router running openWrt. The digi sw is APRX that is a highly flexible digi/igate. Connected to the router internal serial port is a kiss modem. Actually the modem are build in to the box. Tape can make wonders....
The sw should work for you as well.

Hello folks.

I am looking to start a project that may be way over my head. But I am looking to have a small receiver/transceiver connected to a TNC connected to a small embedded board that will operate as an I-gate. I have the TNC, I have the embedded board and I have the radio. What I do not have is an operating system for the embedded board.

I would like to find an operating system that is small, can be run on a Compact Flash card, and it will probably be Linux. A GUI is not really needed.
What comes to mind when you think of small embedded operating system?
What comes to mind when you think of a small program that would run as an I-gate?

My first thoughts were Xastir but I think that may be more program than what I really need. Basically it just needs to receive packets from the TNC and dump them to the internet.

The goal of this project is to have a small, low power consumption, stand alone digipeater site that will feed data back to the internet via wireless network.

Small enough to run on a battery being fed by a solar panel.

Another thing that maybe nice but not really needed would be a lightweight database gathering data from the TNC as well for statistical purposes. Might be nice, but would definitely be an add on later. First priority would be to get it up and running.

Thoughts, questions, comments?
Please.

To add to that request, a list of navigation systems that correctly display APRS data would be great. The only one that I am currently aware of is the discontinued Garmin Nuvi 350. Here is a nice write up of that setup:

I use a Garmin GPSMapCx60. You have to purchase any street maps for navigation as a seperate item, but it works great for APRS, Driving, and Trail use. It's my understanding that any of the GPSMap series should work fairly well.

Good luck,
Adam

The only GPS display receiver really built for APRS is the Avmap G5. They continually work to build new and better firmware, and display actual APRS Icons.

High Altitude Balloon Launch
Posted by: "KB9BVN" kb9bvn@... kb9bvn
Date: Tue Sep 14, 2010 5:50 pm ((PDT))

QRP ARCI is pleased to announce their sponsorship of the Iowa High Altitude Balloon (iHAB) project. This sponsorship is for the second launch by iHAB. This launch will provide improvements over their first launch to include better APRS tracking, an improved 20 meter beacon and better camera clarity.

The launch is scheduled for October 2, 2010 at 14:00Z (9AM CDT) from the Ottumwa Industrial Airport (OTM) IHCC North Campus Aviation Building. Preflight will begin at 13:00Z (8AM CDT). Should weather prevent the launch, the fall back date will be Saturday, October 9, 2010 at the same times.

The QRP Beacon (1.6 watts) will be on 14.059.0 MHz signing (the QRP ARCI Club call sign) "K6JSS iHAB 2"

Please go to http://www.qrparci.org/ for more information on the flight and special recognition for reception reports.

Thanks for all your replies out there. They have been more than helpful. It looks like the WRT is the system to work with. When I go to the site that was given and go to download there seems to be a lot of different models to choose from in terms of hardware. What really is the difference? Is it mostly the chipset that the wireless card supports? Is it more to do with supporting the processor? How do I know which one to choose because my embedded board doesn't fit any of those.

Subject: RE: [APRS] Embedded linux machine for APRS

Hi

one of my digi run on a asus router running openWrt. The digi sw is APRX that is a highly flexible digi/igate. Connected to the router internal serial port is a kiss modem. Actually the modem are build in to the box. Tape can make wonders....
The sw should work for you as well.

Hello folks.

I am looking to start a project that may be way over my head. But I am looking to have a small receiver/transceiver connected to a TNC connected to a small embedded board that will operate as an I-gate. I have the TNC, I have the embedded board and I have the radio. What I do not have is an operating system for the embedded board.

I would like to find an operating system that is small, can be run on a Compact Flash card, and it will probably be Linux. A GUI is not really needed.
What comes to mind when you think of small embedded operating system?

What comes to mind when you think of a small program that would run as an I-gate?

My first thoughts were Xastir but I think that may be more program than what I really need. Basically it just needs to receive packets from the TNC and dump them to the internet.

The goal of this project is to have a small, low power consumption, stand alone digipeater site that will feed data back to the internet via wireless network.

Small enough to run on a battery being fed by a solar panel.

Another thing that maybe nice but not really needed would be a lightweight database gathering data from the TNC as well for statistical purposes. Might be nice, but would definitely be an add on later. First priority would be to get it up and running.

Thoughts, questions, comments?
Please.

Rahn

8043. SDR Dominates the 2010 ARRL/TAPR Digital Communications Conference

Yahoo group: APRS (2007 — 2010)

From: Mark Thompson
Topic: 8043 Message: 8043

SDR Dominates the 2010 ARRL/TAPR Digital Communications Conference09/27/2010
By Ward Silver, N0AX

www.arrl.org/news/sdr-dominates-the-2010-arrl-tapr-digital-communications-conference

The turnout was excellent for the ARRL/TAPR Digital Communications Conference September 23-26 at the Heathman Lodge in Vancouver, Washington.

The three day conference included technical presentations on both Friday and Saturday, and an optional tutorial seminar on Sunday morning. Both Yaesu and ICOM attended as commercial vendors. Although not present at the conference, Kenwood contributed door prizes.

Software Defined Radio (SDR) was the dominant technical theme of the conference. Along with independent SDR developers, the Open SDR group gave a status update, George Heron, N2APB, introduced the SDR Cube www.sdr-cube.com/ project and the conference even featured an “introduction to SDR” forum. Another discussion that attracted a great deal of attention was a project to adapt analog radios to SDR at the IF.

Other conference highlights included a presentation by Rick Muething, KN6KB, on the status of WINMOR, www.winlink.org/WINMOR the sound-card-based HF digital protocol recently incorporated into Winlink’s RMS Express software package. WINMOR promises performance that rivals PACTOR III at a tiny fraction of the cost. Rick also discussed development of this new V4 protocol for keyboard-to-keyboard communication and was at the podium again Sunday morning with his DSP tutorial.

One of the most anticipated talks was given by Bruce Perens, K6BP, on the new Codec2 digital voice codec. This is an open source project that makes significant advances beyond the AMBE vocoder family without any of the licensing and patent issues that have hindered development of Amateur Radio digital voice systems. Bruce stated that by this time next year, the codec should be ready for late-beta deployment on the HF bands.

The complete list of presenters and topics is available at the TAPR Web sitewww.tapr.org

8044. Hacking a USB GPS

Yahoo group: APRS (2007 — 2010)
Date: 2010-10-02 11:31:36 UTC
From: g4ilo
Topic: 8044 Message: 8044

I wonder if anyone has modified a USB GPS to use with a TTL serial tracker? There is an article here http://www.primianotucci.com/default.php?view=28 which suggests that some USB GPS's are simply serial devices with a serial to USB converter, and if you open them up you can remove the USB chip and connect them to a TTL serial tracker (TinyTrak etc.) The advantage is you can buy USB GPS's a lot cheaper than serial ones. However if I buy one for the purposes of modification and it turns out to be a native USB device then it won't be any use to me at all. So I'm wondering if anyone has done this and whether there are any particular devices I should look out for that are suitable for modification?

Julian, G4ILO

Garmins GPS Map60 will allow you to connect to your computer using the usb cable and to your aprs unit using an optional serial cable. Best of both worlds and no modification needed.

Hi Julian

I have a Holux 213U and opened it up to see what was going on in there. Sure enough it was feeding TTL RS-232 into a USB converter. It even has the pads for a standard RS-232 interface chip. It even looks like you could populate it and have both USB and serial output. It looks like they just PCB for both their USB and serial models and just populate them appropriately. Although the signals are there, it's all surface mount so it's a bit small to work with. I'm attaching a picture.

IIRC you should not need null modem adaptor for Garmin GPS III. The TX/RX
are already switched in the cable from the GPS III
Be also sure that in "interface" menu, the setting NMEA/NMEA 4800baud is
choosen.

Does anyone know of a FREE program that pretends to be a GPS and sends NMEA sentences over a serial port? I want to test a tracker that I just built and I haven't got a GPS for it yet. Even if I did, it's impossible trying to get a fix in here anyway.

I put FREE in capitals because it appears that such programs do exist but when you go to download them you find that they really cost $30 - $40.

Thanks. Without it I might never have got the tracker mark and space frequencies correctly set up. Although my VX-8GR received it perfectly on the recommended settings 1184 / 2220 which were verified by my counter nothing was being copied on my TM-D710 nor by AGW Packet Engine even though the braaps sounded exactly the same, and as loud, as others that were being decoded. I had to change the calibration value so the mark was 1200 and the space 2250 in order to get reliable decoding by all methods.

By the way, is a GPS with PS/2 connector compatible with these PIC based TinyTrak type trackers?

The TT3 PIC is happy with serial or TTL levels, and Byonics use to sell the (now defunct) Deluo GPS with PS/2 connector. He may even still have the adapter cables!

Julian
some are. I use a Apex GPS mouse that uses a converter for USB. Works perfectly direct to the PS2 connections.

Another I have is the BR-355 uses a similar system but is not pin compatible (which means I have to re-wire it). It eventually will work (I hope).

High altitude balloon flight to carry 6 meter beacon

The launch of ARBONET-4 will take place on Saturday October 9th, 2010 from the Paris, Texas Hamfest
(www.paristexasradio.com).

The Paris hamfest will be held at the Lamar County Fairgrounds, 570 East Center Street, Paris, Texas 75460.

The ARBONET-4 launch is planned for 9:00 AM from the parking area of the fairgrounds.

ARBONET-4, the fourth in the ARBONET series of High Altitude Balloon flights, will be a demonstration and training flight utilizing beacons on three different amateur bands: 6 meters, 2 meters and 70 centimeters.

The ARBONET-4 payloads are:

Voice Beacon: K5ARB – 435.025 MHz (FM)
CW Homing Beacon (5 WPM): K5ARB - 147.475 MHz
APRS: K5ARB-11 - 144.390 MHz
Hellschreiber / CW Beacon: W5BL - 50.500 MHz

Follow us on Twitter: @ARBONET

Everyone is invited to come out to the Paris Hamfest and see the launch of ARBONET-4!

Try a Haicom , HI-204lll, very sensitive, works in the car parked in the basement, pinouts in the book
with it, for 6 pin mini din. I use a ps/2 extension lead, cut off the socket about 6in from the end & solder
leads directly to the serial pads in the tracker. Then add a DB9 socket to the plug (longer) end as a
null modem cable for programming from your PC.
I have opentrackers & tinytrackers & they all work with this setup.

Sælir félagar, eru einhverjir ykkar með APRS trackera í gangi í dag eða kvöld?

Er nefninlega að gera tilraun með APRS móttöku og ferlun og vantar í raunina fleiri sendingar en mína eigin.

Hugmyndin hjá mér er eftirfarandi:

1) Að geta móttekið APRS pakka frá öðrum aðilum og birt staðsetningu þeirra og skilaboð í forriti sem sýnir kort af Íslandi.
2) Að geta ferlað leið mína í sama forriti og unnið með ferlana GPX skjalasniði og sett inn á t.d. wikiloc og OSM.
3) Sent út staðsetningu mína og skilaboð í gegnum sama forrit.
3) Að geta sett inn uppfærð kort af íslandi inn í forritið og keyrt eftir þeim kortum á hálendi Íslands.

Það sem ég er í rauninni að gera, er að sameinað það að geta keyrt eftir kortum á hálendinu í t.d. slæmu skyggni (það sem ég hef í raun gert í mörg ár með kortaforriti sem heitir Navtrek Nobeltec) og móttekið APRS staðsetningar inná það ásamt að geta sent út staðsetningu mína. Vandamálið sem ég á við í Navtrekinum er að hann skilur ekki waypoint beint frá TT4 og kort í þennan plotter eru orðin úreld og léleg.

Þar sem mér hefur áskotnast aðgangur að nýjustu kortum LMÍ í myndaformi og áttað mig aðeins á möguleikanum að nota Xastir í ferlun er ég að velta fyrir mér hvort ekki sé mögulegt að sameina þetta í eitt.

Hugmyndin hjá mér var svo að setja upp 300baud aprs sendi/móttöku fyrir HF og tengja við tölvuna hjá mér. Þannig að þegar ég fer í fjallaferðir þá geti ég móttekið staðsetningar annara sem og sent út mína eigin ásamt skilaboðum.

Kannske er þetta ógerlegt, en ég trúi því varla.

The Nuvi doesn't do NMEA and the 710 only does NMEA, so you need a Nuvi to NMEA converter aka a GTRANS cable from ArgentData. Here's the Wiki page describing the setup. Just substitute Nuvi for StreetPilot. Note that this still doesn't offer APRS messaging like a Nuvi 350 paired to an OT2m or T2-135.

FWIW, Machine translation by translate.google.com from Icelandic into English:

Hi fellows, are any of you with APRS trac reservoirs running today or
tonight?

Nefninlega is making an effort with APRS and receiving processes and missing in the case sending more than my own.

The idea for me is the following:

1) To be able to receive APRS packets from other sources and display their location and messages in an application that displays maps of Iceland.
2) Being able ferlað my way in the same application and work with the process GPX document format and added to such wikiloc and OSM.
3) Sent out my location and message through the same program.
3) To be able to add updated maps of Iceland into the program and run by maps in the highlands.

What I'm basically doing, is to combine the ability to run after
Maps of the Highlands in such poor visibility (what I've actually done in many years with a map program called Navtrek Nobeltec) and received APRS Placement into it and be able to send out my location.
The problem I have with the Navtrekinum is that he does not understand waypoint directly of TT4 and maps in this plotter has become úreld and poor.

Since I have áskotnast access to the latest maps NLSI in video form and appreciate only the ability to use Xastir in the process, I'm wondering me if it is not possible to combine this one.

The idea for me was to install 300baud aprs sending / receiving for HF
and connect to the computer with me. So when I go to the Highland
I received other locations as well as sent out along with my own message.

Perhaps this is impossible, but I believe it either.

When I first got my ham licence, age 16 1964, a friend of my father's asked me what the purpose of ham radio was and why I went to all the trounble, passing an exam etc, to get my ham licence. I had to tell him that I had not yet been asked that question and it took some time for me to come up with a reasoaable answer.

On one hand I am all for aprs gps but I have a question. What is it's purpose?. I was involved in a demonstration of APRS at our ve3cne (canadian national exhibition) during the late 90's and I asked essentially, the same question about aprs. APRS could almost be considered the forrunner of GPS. But what is the purpose of aprs. gps?...

p.s. I have the board...

We use it for weather spotting during summer storms. Don't have to worry about telling Net Control exactly were you are because they already kniow exactly were you are. You can overly a Weather Radar image with the Aprs data and make direct coralations between reports taken and the weather radar.

And thats just one use.

I'm not sure what you mean by "APRS.GPS". I assume you mean using GPS enabled tracking with APRS?

In that case, we've been using it a lot here to support public service events.

Case in point yesterday, we supported a charity bike ride with multiple courses ranging from 21 to 65 miles. We had trackers in the SAG vehicles and multiple other support vehicles. Net control was able to see (using APRSPoint) where each vehicle was and keep track without having to tie up the voice net, leaving it free for logistics and possible emergency traffic if needed.

We had a situation with a vehicle sent out with extra supplies to a rest stop. The direct route was blocked by a traffic accident. Net control was able to pick an alternate route from the map and direct the truck around the accident scene and to the rest stop.

Now, for the "text book answer", assuming I'm paraphrasing W4APR correctly, APRS is a real time information exchange system. GPS enabled stations/trackers allow for automated updates of the local situation for all users. They ARE NOT the primary purpose of APRS, nor are they necessary. They simply make it more convenient for mobile stations to keep their position updated. I've done several public service events where I've manually updated asset positions based on voice traffic. Requires a dedicated op, but since I was simply watching an empty road in front of me for most of the event...

Another use is Balloon tracking, launch a balloon with APRS on board and you can track it, send telemetry back such as temperature, and hopefully track and find your payload.

Also I can view fellow amateurs as they travel and message them for a chat. Handy for events where people can see where you are on a map and you can see them and guide them in to your event by the best route. Not the one the sat nav tells you.

I guess the answer to that is the same as the answer to the question "what is the purpose of ham radio?" After all, with phones, Skype and the internet who needs ham radio just to talk to people? It's a hobby, it doesn't have to have a purpose, it just needs to be fun and interesting. Some people use APRS tracking just so family or friends can see where they are. But if you are involved in emergency communications then being able to see where everyone is, and other important locations, and being able to send text messages when the voice channels are busy can be really useful.

>

And like most things in Amateur Radio, we use the infrastructure for routine things so that we know the infrastructure will work when we need it, "when all else fails". Thankfully I've not been involved in an emergency yet, but I'm learning the capabilities and reliability of the system so that I can know what to expect when I/we need it.

I use it to see where my wife is relative to me when we're both out to see if we can link up for dinner. Why call her, especially when she's mobile, when I can just glance at my Nuvi or phone and see where she is and if she's moving or stationery. I've used it to watch my kids on a road trip and called them when they missed their turn from I-95 to I-26. We also play "APRS Tag" here in town whereby if you are tracking and someone else is tracking, you can tag their windshield with "I was here". The rule is, the two tracks have to overlap or touch at aprs.fi.

Another nice use is it makes it easier to find and talk to other moble users. Instead of saying CQ on a simplex frequency every 5 minutes while driving you can let your APRS beacon do the same thing. As soon as you see somebodu in range on APRS you can then call them directly by call sign. A lot of people put a frequency that they monitor into their APRS status message.

This is my primary use of APRS, I use it in my, and my YL's Mobile so that we can see who's around, and if there are any travelers in the area that also use APRS. We provide Repeater objects which list Frequencies, Ranges, and Net times, along with SkyWarn responsibilities in our area. When I travel I love to see repeater objects show up on my screen so I can make local QSO's and have a nice chat. I advertise my voice repeater monitoring status in my comment so that people know where to call me by call sign when I'm out and about my local area.

We also use APRS for trackers in special events as was listed earlier, our major event travels around one of the Finger Lakes in NY and is a 100 mile ride. The trackers are useful in mechanical and SAG vehicles along with front runners and sweep vehicles. the event coordinators love the ability to see on a map the general lay out of the event, we include objects for ALL of the rest area's to help give perspective. It makes NCS jobs easier by identifying all of the support vehicles, and we list the repeater frequency that they have been assigned as we normally utilize 3 different repeaters, and a simplex channel for coordination.

When I'm asked to summarize why I use APRS, I say, Because I love digital modes, and because it's a great source of information for travelers, and has almost limitless possibilities for sharing information with other operators, some of the time with out an operating being present at the radio.

driving you can let your APRS beacon do the same thing. As soon as you see

somebodu in range on APRS you can then call them directly by call sign. A

lot of people put a frequency that they monitor into their APRS status

message.

Subject: [APRS] Re: What is the purpose of APRS GPS..

I guess the answer to that is the same as the answer to the question "what is the purpose of ham radio?" After all, with phones, Skype and the internet who needs ham radio just to talk to people? It's a hobby, it doesn't have to have a purpose, it just needs to be fun and interesting. Some people use APRS tracking just so family or friends can see where they are. But if you are involved in emergency communications then being able to see where everyone is, and other important locations, and being able to send text messages when the voice channels are busy can be really useful.

From: Robert Bruninga
Topic: 7931 Message: 8082

> But what is the purpose of aprs.... gps?...

The purpose of APRS is to provide a single continent wide data exchange channel where information about EVERYTHING going on in ham radio is being announced. No matter where you are, monitor the APRS channel (144.39 in North America) and in 10 minutes you should have all the informaiton about what is going on locally. In 30 minutes you should accumulate an idea of what is going on in the region.

Unfortunately, in too many places, nothing is going on in ham radio (that is being announced on APRS), and so there is nothing to see...

> ...gps?

The purpose of GPS is to make it easy to see where you are. Useful for people who cannot read a map or are lost.

Bob, WB4APR

Larry,
You stated the following:
"When I first got my ham licence, age 16 1964, a friend of my father's
asked me
what the purpose of ham radio was and why I went to all the trounble,
passing an
exam etc, to get my ham licence. I had to tell him that I had not yet
been
asked that question and it took some time for me to come up with a
reasoaable
answer."
So, what reasonable answer did you come up with to address his question?
Thanks,
Joe, N2QOJ

What is the purpose of...

Substitute plain English for the special words.

"APRS.GPS" means "sending someone else, somewhere else, position information about something".

So "what is the purpose of sending someone else information about the position of something" ?

After youve written down fifty answers besides "My car crashed would you please come take me home?" I think you'll see the question answers itself.

APRS.GPS. Ugh! Where did whoever come up with that one?

Like all of the others listed so far. We have used APRS with GPS in search and resuce in our area. We have also used it in numerous bike races and marathons to cordinate the event and locate aid stations. There are so many applications to use APRS GPS. Do a Google or Yahoo search and see the many ways it is used.

Oddly enough, the one answer I haven't seen yet is: "Because we can!"

Why does there have to be a specific reason? If you're interested, do
it, if it's not for you, don't.

Cleb,

I've nothing much helpful to offer other than wondering if you've tried using any other symbols to see if they work.

I'd try shooting an email to Byon direct and/or getting on the TinyTrak group (if you haven't already) to see what they say there. I've had great responses both from Byon and from that group.

Let us know what you find out.

8093. 30 meter APRS

Yahoo group: APRS (2007 — 2010)
Date: 2010-10-19 18:46:21 UTC
From: Fred VE3FAL
Topic: 8093 Message: 8093

All the other bands look like they are full of people, but notice 20 meters is up and down like a yo-yo.
Been playing on APRS HF again today for portable use but only copy W8LIW-15, usually have quite a few on 30 meters.
Has everyone gone to PSK APRS on Hf or is it just bad cdx on that band today?

Yes. See here: http://sv8ym.blogspot.com/2010/07/mysterious-case-of-withering-filters.html
.

There is a group dedicated to the D700 and D710 radios which would be a better place to ask for more information.

By Kam software are you refering to the HostMode software that Kantronics used to sell or are you talking about the Prom?

Version 7 will do anything you might want to do. there are some work arounds for setting it up as an APRS Digi though.

You'll need to find a different version ROM. 8.2 was the last version hey made and you can no longer buy one from Kantronics. I used a KAM Plus with version 7.0 for APRS but had to use it in KISS Mode with UI-View32 to do so. It worked as an iGate as well as a DIGI. It is the only way I know of doing so.
Maybe somebody here has an 8.2 ROM they'd sell. I'd like to find one for my KPC-3.

From: gervais
Topic: 8103 Message: 8103

Hi all

i am going on the road time too time for my job: i want to use one of my Laptop too "look at APRS" when i will be on the road.

What setup do i need exactly?i am a bitt confuse what hardware ?

I am ruuning XP sp2

Thanks

Gervais ve2ckn

Hi Gervais,
The basics will be a TNC of some sort be it a Tracker
type or a TNC , a GPS unit to fit your comms port, a radio and what ever
program you want to run on the laptop, plus maps

I use UIView and DRSI TNC and a USB GPS. IC22s and a 5/8 colinear antenna
if I want to look at the others usually I just run my tracker.

8109. Xastir v2.0.0 has been released

Yahoo group: APRS (2007 — 2010)
Date: 2010-10-26 03:18:12 UTC
From: Curt, WE7U
Topic: 8109 Message: 8109

Xastir v2.0.0 is available on SourceForge at:

http://sourceforge.net/projects/xastir

or via CVS.

This release includes several bug-fixes done in the last few months
plus the really big thing: Open Street Map support! Enjoy!

--

Hmm. My initial interest in seeing that Windows is supported soon turned to disappointment after I downloaded the file, opened it and found a load of source code files. If you have a PhD in computing then perhaps you can make it work under Windows, but until someone makes a ready to run EXE file I'll stick with APRSIS32.

You should at least explore the rest of the Xastir website. You don't need a PhD in computer science to compile Xastir. The instructions are well written and step by step. It takes a little time but it works.

Here's the link to the Windows binaries that have been made by various volunteers:

http://www.xastir.org/wiki/Downloads#WINDOWS

Right, see this link. In order:

1) See the Windows links here first: * / Installation Notes
<http://www.xastir.org/wiki/index.php/Installation_Notes> /*Linked page
has no text...

2) VMWare player images via Torrent - newest one is on page 4 from
090816. Page 1 offers 090713.

3) Next entry is plainly labeled (old)

4) Next is not only old, but "nominal fee".

5) As is the next one without even a link.

6) And then the mentioned "Install from sources".

7) Followed by links to "A few more docs".

Where's the pre-built .EXEs you were mentioning, specifically of the
v2.0.0 release?

Lynn (D) - KJ4ERJ - Author of APRSISCE/32 - A NATIVE Windows APRS client

The Xastir project releases source code. Individual users sometimes release binary packages for various OS flavors. I sometimes create binary packages for OpenSuSE or LSB as I find time, not as part of the project but as an independent effort.

The Xastir sources were just released last night and already I see that Jeremy has a package for OSX!

Most of the Wiki pages are user-generated. If there are errors, point them out on the Xastir list and hopefully they'll get tweaked quickly to compensate.

We as a project don't have the time/energy to create binaries for everything Xastir can run on. If we tried, we'd spend all our time creating such packages and little on software development. There are precious few hours available for development as-is.

Give it a bit of time and someone may update instructions on the Wiki and/or create a link to a binary file that may interest you. If not, Lynn's program APRSISCE/32 or UI-View are certainly good options, and there are plenty of other Windows programs to choose from!

8115. APRS Packet Errors

Yahoo group: APRS (2007 — 2010)
Date: 2010-10-27 08:30:19 UTC
From: w7boz
Topic: 8115 Message: 8115

Could someone please look at the link below and tell what all the packet errors are with my callsign?
Thanks, Kevin
W7BOZ

http://www.aprs.net/cgi-bin/errors.cgi

8116. Re: [APRS] APRS Packet Errors

From: Lynn W. Deffenbaugh (Mr)
Topic: 8115 Message: 8116

I only see your W7BOZ call there twice as an IGate for someone else's packet. http://aprs.fi/?c=raw&call=w7boz&limit=50&view=normal also doesn't show anything strange.

You'll have to capture the actual packets you have questions on as these two sites are time-varying and by the time we see your request, the packets may be gone.

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile and Win32

PS. It may be complaining about your WIDE3-3 path. Fixed stations in the US are recommended for WIDE2-1 only. Most of your packets make it to another Igate in 1 hop anyway.so unless you're actually have services to offer stations 100s of miles away, WIDE2-1 is probably better for the network.

See also the APRS coverage maps for your area at the following URL. Newest is at the bottom.

http://ldeffenb.dnsalias.net.nyud.net/Tracking/Act24/*NW*

Or browse them all at http://tinyurl.com/APRSAct24 and http://tinyurl.com/APRSAct00

8117. Tinytrak type tracker with TH-F6A/F7E

Yahoo group: APRS (2007 — 2010)
Date: 2010-10-27 17:33:15 UTC
From: g4ilo
Topic: 8117 Message: 8117

I have built a FoxTrak (which I believe is a clone of the original Tinytrak, using a 16F84 PIC). I made up an interface cable for a Kenwood HT and it works fine with my 25 year old TH-205E needing the audio out pot set to just above minimum to provide a good signal. When plugged in to my TH-F7E (European version of the TH-F6A) there is no audio at all. Even with the pot wound to max and the dip switch set to high audio level (which takes a series 10K resistor out of circuit) the audio is far too low.

I have an accessory speaker mike which works with both radios giving adequate transmit audio so there is not a problem with the external mic socket on the F7E as far as I can tell. Since the Foxtrak works with the TH-205E there can't be anything wroing with that either. I have made two separate attempts at wiring up the connecting cable with tx audio to the ring and PTT to the sleeve of the 3.5mm connector and ground to the sleeve of the 2.5mm connector as shown in the TH-F7E manual and neither gives any audio on the F7E. I can't for the life of me see what I am doing wrong. Has anyone used a tracker with one of these radios and experiernced this problem /found a solution?

It just came out not two days ago, give it a little time and there likely will be a VMWare package showing up very shortly. No need to be snippy.

I wasn't being "snippy", I was just pointing out the lack of "Windows binaries that have been made by various volunteers" that you said could be found at that link. A pre-built VM isn't a "Windows binary" by my definition anyway.

8120. Re: [APRS] Tinytrak type tracker with TH-F6A/F7E

Yahoo group: APRS (2007 — 2010)
Date: 2010-10-27 17:57:42 UTC
From: Curtis Looper
Topic: 8117 Message: 8120

Not sure if it is your problem, but on of the jumpers on the OT2m by Argent Data is for the option of PTT activation, most HTs will use a common configuration, but the Kenwood (and compatables) use the connections you have referenced below. The PTT is handled differently on the Kenwood HT and you may have to verify the settings and pin-out connections on your tracker to verify it is expecting the signals on the correct pins, etc.

Several people complain about having to change the jumper on the OT2m when going from a Kenwood HT to another type of radio or HT, your tracker may need to be re-configured as well to work properly with the HT.

Hope this helps lead you in the right direction.

There is a dip switch that switches a 2.2K resistor to handle PTT for some hand helds but that doesn't seem to be necessary for the Kenwoods. PTT works fine on both transceivers, the problem is on the TH-F7E the modulation is inaudible even at a much higher audio output setting than that needed to produce a correctly deviated signal from the TH-205E.

8122. CMOS or RS232?

Yahoo group: APRS (2007 — 2010)
Date: 2010-10-27 20:55:01 UTC
From: Juan Tellez
Topic: 8115 Message: 8122

Does the TT3 or TT4 uses CMOS or RS-232 levels from GPS? I have some GPS boards that want to use in a club APRS project and the manual indicate as follows

11
O
TXA
Port A Serial Transmit Data. VCC CMOS levels. GPS messages.

12
I
RXA
Port A Serial Receive Data. VCC CMOS levels. GPS commands.

13
I
GND
Ground

14
O
TXB
Port B Serial Transmit Data. VCC CMOS levels.

15
I
RXB
Port B Serial Receive Data. VCC CMOS levels. Differential GPS messages.
Any help appreciated.

JT, XE2SI

The TT3 uses either 5V TTL, or Inverted 5V TTL (which tends to be
compatible with RS-232).

The TT4 uses a MAX232A chip, which is bypassable on PORTB, so it can
speak 5V TTL or +/- 12V RS-232.

I expect the CMOS port to be compatible with TTL.

You're also pointing out a lack of a binary for the absolute latest stable release which came out only a couple days ago and hasn't been given time to be built by the various volunteers that build VM versions.

The way the prebuilt VM is set up it most certainly is equivalent to a Windows binary because everything is already compiled and ready to go. Just double click the VM and Xastir is up and running. Is it natively compiled for Windows? No, you'd have to use Cygwin for that. But the VM does behave like a Windows program so does it really matter that it's another OS hiding in the VM window? Xastir is running, it's running under Windows and that's what the OP wants.

Give it a few weeks and the VM will probably show up ready to go.

Does it behave like a Windows program to the extent that it can interface with TrueTTY (a sound card packet modem that emulates a TNC through a pair of virtual serial ports) or APRS Messenger (which I think uses a TCP connection) running natively under Windows?

Hi Lynn,
I would figure that Wide2-2 would work in my area. But everyone, and I mean everyone in my local area is running Wide3-3. There are other rural stations and areas that have no Igate access. Maybe you could look over the data if you have a chance and make a recomendation for me and everyone else in my area. And maybe let me know if my Igate is serving people as needed.
Thanks, Kevin

It interfaces with AGWPE. Close enough?

8128. APRSdroid down?

Yahoo group: APRS (2007 — 2010)
Date: 2010-11-03 13:09:57 UTC
From: Lynn W. Deffenbaugh (Mr)
Topic: 8128 Message: 8128

I was asked today about a droid APRS client and was going to point the response to:

http://aprsdroid.org/

however that link seems to redirect to a broken link. Interestingly, the download link (http://aprsdroid.org/download/) still produces a list of files so the domain is still good. But without information, I think droid users will be expected to know more than xastir users to get their client operating...

If anyone knows how to contact the APRSdroid author, please see if he can get his links fixed.

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile and Win32

With Droid becoming so popular, its nice to see an APRS client for it. Although I am sure it is nowhere as good as Lynn's creation. Probably like Xastir and not good enough for the everyday user. I don't know, or care enough about compiling programs to bother with those types of programs. Maybe someday Lynn will create a Awesome Droid version. All ready compiled. :)

APRSdroid is just a tracker. It sends position reports to APRSIS via the internet. That's all. It barely qualifies to be called a client. It doesn't stand comparison with Xastir, which would actually be a very good program for the everyday user if it could be installed on the platform used by the everyday user (i.e. Windows) just by running a setup program like everything else.

Unfortunately the practical realities of developing software for different platforms mean that not one line of code written for Windows Mobile will be of any use on the Droid, nor the iPhone come to that. So the chances of seeing APRSISCE for Android are probably about the same as that of Lynn winning the lottery, assuming that he would then wish to spend the rest of his time developing mobile APRS clients. :)

The droid app is nothing more than a commercial tracker and tied to a ham radio interface. At what point do you say stop. if you want to make a commercial tracker then build a commercial viewer and stop cluttering the APRS servers. It seems that the weather side was moved off to the side over a year ago.

I studied code for about 1 month. And I sayed, "I never care to do that ever again!!!" Besides doing Basic back on my old TI-994A :) So I understand how complex writting code is, EX for multi OS. It is just that there are multiple OS out there. Meaning if you love APRSISCE, and get a new Droid or IPhone you are at a real loss. What we really need is some programers "with Lynn's permission and other stuff", to write code for the other OS's. At this time it does not matter to me. Since I use a pre-paid phone for phone calls. But love the use of a "Cell Phone", to interface with my TH-D7A/G.

Anyone and everyone has "Lynn's permission" to copy anything about the interface and operation of APRSISCE. The only thing they won't have for quite some time is the actual source code. As was pointed out, it is VERY Windows API specific. I don't use any frameworks or libraries to assist, but code in straight C (not even C++) to the Windows API.

But as for the look and feel and operations, once they're out in view of the public, I couldn't protect them if I wanted to. So, any Android or other platform programmer out there, have at it!

Then again, if you port Wine-type technology to Java, you'd probably be doing the whole world a big favor! (NOT!)

8136. APRS weather station

Yahoo group: APRS (2007 — 2010)
Date: 2010-11-13 17:19:45 UTC
From: Wayne
Topic: 8136 Message: 8136

Is anyone using one of the cheaper weather stations such as the Ambient WS-2080 or WS-1050 or others for an APRS remote located station. If so, how was the connection to the TNC made. It looks like the USB to serial connection may be a problem but if someone has figured this out we would like to know.

The location of our APRS station is very prone to lightning and we don't want to put in an expensive station.

Thanks

Wayne WA5LUY

We're selling our ADS-WS1 station for $155, and you don't need a TNC
with it.

https://www.argentdata.com/catalog/product_info.php?cPath=29&products_id=135

The wind and rain sensors should be the same as those used in the
WS-1080 and probably some others - we get those parts from a factory in
China that makes stations sold under a number of brand names.

The ADS-WS1 is cheap as APRS-capable stations go, and replacement parts
can be ordered for it. It's got transient voltage suppressors on the
external sensor inputs, but we haven't had much chance to see what a
nearby lightning strike does yet.

Looks like we're going to be out of stock for about 2 weeks, though. A
new board revision is on the way now - the biggest change is an added
diode for reverse bias protection, since people seem to frequently hook
them up backwards.

Hi Scott,
Thank you for the quick reply. From the web sight this looks like what we need. Although a TNC may not be needed we have two locations that use Kantronics KPC3+ V9.1 and assoaciated radios for digipeaters. We want to keep the existing TNC's and simpley add the weather information to these TNC's via the serial port to be used as a beacon.

Am I safe to assume the serial out port on the WS1 can be used for this connection? If not will the WS1 also provide digipeater capability. Any suggestions and additional information will be appreciated

Hi Wayne,

The WS1 puts out Peet Bros data logger format. I think the KPC-3+ might require the $ULTW prefix, but I'm not certain. I'll be adding that as an option when I have time.

Im considering a new purchase to upgrade what i have been using. I will be upgrading the gps as well. What will be the best combination for mobile use using a d7oo and a d7 for aprs mobile work. I would like to use bluetooth to keep the tangled mess of wires to a min. Is there a gps that is bluetooth that the laptop can read for use in aprs. what would be the best laptop and os to use and lastly, I know the trouble of getting uiveiw to work on the newer os but i have pmap 8 and would still like to have the ability to zoom in when needed. I have tried winice 32 but have to dl the tiles ahead of time for mobile ops. I am no noob to aprs just have questions on the practical mobile setup. Prefer a gps that powers from the vehicle, as i am tired of changing batteries all the time. so all info is welcome...

Hello Wayne
Thank you for the link to the pdf.
Well, it is not so easy to treat such APRS frames cause of the many different formats that may be used : with or without timestamp, with or without positions, wind direction and wind speed may be coded as c...s... or .../... ! I have read that some weather softwares create a text file name WXNOW.TXT but even that file may have a different format according to the software that creates it.
Well standardization is still not the rule !
Thanks again for the reply.
Gabe

if you didn't change anything on your radio, I would check to see if the normal IGate for you is still in operation. Just because you're not hitting the web doesn't mean your radio isn't working.

Subject: [APRS] not showing up on APRS.fi w/ VX-8DR

Well.. I had this working once before, for some reason I am not showing up on aprs.fi ? I don't think I changed any of my settings. I turned off the battery saver Menu 79/80

Anyone have any suggestions?

Well, according to aprs.fi, WD6FOX hasn't had any active stations for
the past year (at least, I believe that's how long inactive stations are
retained). When did you last have it working and what callsign-SSID was it?

Sorry.. WD6FOX-7

I had it working on 10-10 I had it in the truck as I was driving around. Right now GPS Is working, and I have the radio hooked up to an external antenna?

Thanks,
Sean

One "glitch" I have found with the VX8DR is if your battery is down it may not quickly link up to the GPS I generally have it plugged into my power plug in my car when I am traveling.

Hope that helps

Music Matt,
Instead of a laptop.. How about a Smartphone to interface with your radios??? Have you checked out APRSISCE??? There is a way to use a Smart Phone with GPS to interface with your radios using Bluetooth. Check it out. I am working on a nice little "bluetooth to serial" interface in the APRSSICE Yahoo group. Check it out and the archives.

Jan, the new radio appears to be a completely different size making it unlikely the new battery would fit.

And considering that LiOn batteries usually have rather different charging profiles, the "fixed amp fixed volt" trickle charge from a D7 is likely to be problematic for a lithium battery as well.

8156. GTRANS cable and Nuvi 3750, 3760, 3790 series

Yahoo group: APRS (2007 — 2010)
Date: 2010-11-17 00:17:24 UTC
From: Ken
Topic: 8156 Message: 8156

Has anyone tried the Argent Data Systems GTRANS cable with the new Garmin 3750 3760T or 3790T? Obviously with the 3760T and 3790T you would loose the traffic capabilities (they are built-in the stock Garmin power cable).

Looking through the Garmin FMI (fleet management interface) webpages, I don't see any mention of the 37xx series. Maybe it is too new to be listed (if it is capable)? Nor does the 37xx pages mention any of the Garmin FMI cables as being an accessory.

If we don't have any test data, and someone has an extra GTRANS cable, I'd be willing to try it with my 3760t, and return it afterwards. I'd even pay USPS First Class shipping both ways.

I'm also aware of the AVMAP G5 and it's capabilities.

Currently I'm using a Deluo with my D-700 I picked up a few years ago at Dayton from Jason @ RPC Electronics (which replaced a dead Garmin III+)

Thanks

The GTRANS cable does not plug into the power port, it plugs into the data port, so you should not lose any capabilities built into the stock power cable.

Most of the newer models have a single USB connector that carries power
and FMI. The Garmin FMI 10 cable (010-11232-00) has a power supply
built in.

The GTRANS2 has the same form factor, and also has a 5-volt supply in
the box. We've only shipped a couple of them for testing so far.

You are right. The radio looks to be of a different design and size. Very unfortunate. Although I need to rebuild an old battery pack. And I have found some Sanyo lithium Ion prismatic cells that I can fit into the old pack. I will need to wire a new Lithium Ion charger of the same voltage to an older NI-CD charger/holder. Oh well, thats the fun of Amateur Radio. :)

Scott,

That's right. The 37xx series only has a single USB connector.

What differences are there between the GTRANS2 and the FMI 10?

Any preliminary test results you can reveal, or a production time frame?

Are you looking for an additional tester?

Regards,

Ken

The FMI 10 cable is just a level shifter and power supply. The device connected to it still needs to speak the FMI protocol - which generally means either a commercial AVL system or the Tracker2.

The GTRANS2 (like the original) has a microcontroller in it that converts between FMI and NMEA so devices like the D710 can use it.

FMI 2.5 adds a new waypoint creation protocol, which works, but last I checked the user interface still wasn't quite there - you can create waypoints, but the don't automatically show up on the screen.

I'll be working with FMI 2.5 mostly with the Tracker2 for now. Once I'm satisfied that everything is working there, I'll move the new waypoint code to the GTRANS2. For now, all the GTRANS2 is really good for is getting NMEA position, velocity, and time data out of a newer nuvi.

Don't forget to set your APRS radio for Voice Alert when on the
open road this busiest travel day of the year!

While you are sitting there stuck in traffic, enjoy the company
of a new ham passing by in the other direction typically every
10 minutes... (though 98% of them are not running voice alert,
so you don't know they are there)...

If you don't understand Voice Alert, see
www.aprs.org/VoiceAlert3.html

Or if you aren't running it, you can still listen for passing
APRS mobiles in simplex range that are, simply by tuning ANY
mobile rig to 144.39 with CTCSS set to 100 (in the USA).

Bob, WB4APR

8165. Antenna mounting

Yahoo group: APRS (2007 — 2010)
Date: 2010-11-24 16:47:22 UTC
From: Dan Bowkley
Topic: 8165 Message: 8165

Hello all,

I'm a long-haul trucker; until recently I owned my own rig and therefore could pretty much stick whatever kind of antenna wherever I felt like sticking it. Alas, I had to give it up and am now driving a company-owned Cascadia which I am prohibited from modifying in any way. Most trucks have a tubular framework supporting the mirrors to which I can clamp a mount...not the Cascadia. Frankly I'm about out of ideas how in heck to pull this off--I've even contemplated building a suction cup mount!

Does anyone have any ideas how I might go about non-permanently mounting a 2m antenna to the outside of a fiberglass truck, with no holes, and getting the cable up to my dashboard? Would a through-glass antenna work worth a fart?

Thanks,
Dan kg6ohk

I haven't driven a FreightShaker since the early '90s, but back in 2000 I drove a Kenworth T2000. As you know they have 2 plastic antenna mounts up high on a plastic truck. Needless to say, it didn't work very well. Anywho, I went to the shop and spoke to the guy who installed the radios and antennas, told him my issues and slipped him a 20. When I got back from my time at home, my truck had my new antenna and feedline installed and working correctly. It is very likely that this guy is going to know nothing about Amateur Radio, so you'll have to educate him a little. I'm sure as small and light 2M antennas are, you'll have no problems.

Topic: 8165 Message: 8167

i had the same problem with my jeep wrangler, dan...canvas top and plastic rear windows. i finally decided to try a thru-the-glass antenna on the front windshield and found that while it is *not" better than an antenna mounted on a metal ground plane it *was* acceptable. on a scale of 1-10 with 10 being fantastic, i'd rate my glass antenna as an 8. i can hit all of the repeaters in the area and my car-car simplex range is several miles. car-car simplex with another vehicle using a TTG antenna is less.

if you can't modify the truck literally in *any* way and you don't have the tubular mirrors then your only options are a TTG antenna or maybe one that clips to the passenger side roll down window. i've seen the latter for cell phones but not for 2-meters. if your truck AM/FM uses a traditional stick antenna you might be able to find an adapter for your APRS radio that uses that antenna. i think i'vr got something like that in my junk box. i know i've seen them.

gud luck es 73
rich, n9dko

Hello all,

I'm a long-haul trucker; until recently I owned my own rig and therefore could pretty much stick whatever kind of antenna wherever I felt like sticking it. Alas, I had to give it up and am now driving a company-owned Cascadia which I am prohibited from modifying in any way. Most trucks have a tubular framework supporting the mirrors to which I can clamp a mount...not the Cascadia. Frankly I'm about out of ideas how in heck to pull this off--I've even contemplated building a suction cup mount!

Does anyone have any ideas how I might go about non-permanently mounting a 2m antenna to the outside of a fiberglass truck, with no holes, and getting the cable up to my dashboard? Would a through-glass antenna work worth a fart?

Thanks,
Dan kg6ohk

Check out "NAGOYA RB-CLP-BNC Window Clip mount" on eBay. You can put any VHF/UHF antenna with a BNC plug on there, if it isn't too big.

I use a glass mount on the rear window of my pickup truck because of garage door height limitations.
It does work, but best to the rear. It does not work as well as a quarter wave mag mount on the roof
of the cab.

APRSISCE/32 works on both Windows Mobile and Win32. Read about it in the fledgling Wiki at http://aprsisce.wikidot.com/ . There's a link from there to the APRSISCE Yahoo group that you can join to download your free copy for either platform.

APRSIS32 is no doubt the simplest and most well supported package out there. It's still Beta, but it's in active (e.g. often updated daily or even more frequently) development. If there's something you don't understand, all you need to do is ask. There is a Yahoo group supporting it. There is no need to be confused or condesending.

Try Xastir. Also under development, recently updated to v2.1, runs on any platform. I use it on OSX, others on Unix, some on Linux there are even a few running on Windblows.

Good Luck.

8179. RE: [APRS] Antenna mounting

Yahoo group: APRS (2007 — 2010)
Date: 2010-11-25 13:21:59 UTC
From: George
Topic: 8165 Message: 8179

I did not want to mount any antennas on my new Grand Marquis, so I tried a product from E-bay called a "license plate antenna". Probably overkill for a truck, but it works well. In essence, it is two wire dipoles that are mounted with duct tape inside the front and rear bumpers. A power divider splits the signal from the radio to provide half the signal to the front and half to the rear. What I am thinking is a wire dipole mounted as high as you can, either inside the cab (fiber glass), or somewhere outside, and fed directly to the radio. At 2 meters, you are going to have a dipole approximately 38 inches long, so it should be easy to do. You might even use thin wire, or possibly the metal tape used on windows for burglar alarms, and run it across your windshield. For APRS, you are probably not using more than about 5 watts, and very low duty-cycle, so RF-exposure will be low.

Subject: [APRS] Antenna mounting

Hello all,

I'm a long-haul trucker; until recently I owned my own rig and therefore could pretty much stick whatever kind of antenna wherever I felt like sticking it. Alas, I had to give it up and am now driving a company-owned Cascadia which I am prohibited from modifying in any way. Most trucks have a tubular framework supporting the mirrors to which I can clamp a mount...not the Cascadia. Frankly I'm about out of ideas how in heck to pull this off--I've even contemplated building a suction cup mount!

Does anyone have any ideas how I might go about non-permanently mounting a 2m antenna to the outside of a fiberglass truck, with no holes, and getting the cable up to my dashboard? Would a through-glass antenna work worth a fart?

Thanks,
Dan kg6ohk

How about duct taping a J-pole antenna on the back of the cab?

Interesting Idea....

http://www.kb3kai.com/j-pole.php

Roll Up J-Poles actually work very well in my experience.

I didn't want to drill any holes in my Durango, so I ended up building an aluminum bracket to bolt to the luggage rack, and chance of doing something like that?

Bob-
TTG antennas are meant for specific types and thicknesses of passenger car glass and how well they work varies with whether "your" glass matches their design spec. But I'd call gluing on an antenna "modifying" the window, wouldn't do that without written permission because someone could use it as grounds for termination, right?
Suction cup mounts work very well on clean surfaces. Wipe it down, suck it on, done. The ones using twin glass/mirror/floor pickup handles work very nicely and no one can accuse you of "modifying" the truck.
Unless you've got a vertical pipe (exhaust stack?) or something similar behind the cab, where you could use a couple of padded pipe straps to clamp something on?

Since I do a lot of driving in the middle of nowhere, I keep the power on my ft7800's med-hi setting. I do like the double dipole idea though, might have to look into that. Maybe just a single across the windshield even, iirc the foil tape would give a wider freq response too? The windshield halves are each about 38" wide, so plenty of room, and the center post would hide the feedline perfectly.

While I'm thinking about it, has anyone come up with a variable power thingie yet? We should always use the minimum possible, yet I really have no way of knowing if I'm using enough...can we maybe have a gizmo that listens for my own packet being digid and cranks up the power until it hears itself? Nearby qrm would increase but it'd keep long range qrm waay down compared to having me just run 50w all the time.

Having anything between the back of the cab (sheet metal) and the front of the trailer (also sheet metal, except with a diesel powered fridge hanging on it) would probably do very nasty things to the swr...I'd think the signal would just bounce around like mad back there. The entire back of the cab as well as the sides up to the tops of the windows are metal, the roof and upper sides are fiberglass. I saw a 6m loop antenna somewhere, kinda thought about building one for 2m and hanging it from the ceiling, except I would also like to keep my rig looking...well not like a mad scientist's lair. :D

And of course the top of the rig is 13' off the deck, and I can't be more than 13'6" high overall. Humbug.

QST magazine had, within the last 12 months, an article on a DIY no-holes, window mounted VHF antenna. I will go through the issues I have at home later and try to find it, will post here issue and page numbers if I come across said article.

Have you tried the Comet or Diamond mounts for the front edge of the drivers door? These mounts will 'rotate' into any position.

Fire trucks have aluminum skin so our RACES guys use heavy duty suction cups, the kind used in computer rooms to remove the heavy floor tiles, as mounts. These have 2 powerful suction cups mounted on a metal or plastic frame and can be mounted on the side of the door or the roof. Depending on the model on hand, drill and tap for 3/8x24 or weld a base for a mount. If on the side of the plastic door, add a 21 inch radial to the coax side of the connector for a ground plane.

We also use a special type of duct tape that leaves no residue, the mag mount base, usually of large diameter, is simply duct taped to a top surface over the top of a metal ground plane. Here is how to build the ground plane wire. Take some old PC ribbon cables, 2 of them, 42 inches long, cross them in the center(no electrical connection necessary) forming 4 spokes of 21 inches. Place the cross over point under the antenna mount before duct taping the mount to the roof. Now you have your vertical whip on top of a nice ground plane. Copper flashing is easy to find and works great, same construction and application of tape.

Coax seems to fit fine under the bottom of the door, seems design engineers leave more space at the door bottom than anywhere else so tape the coax down the door where it won't show too much and then up the bottom of the door, inside to your operating location.

Sounds wacky but it should work.

I drive an all fiberglass motor home on a Ford Chassis, similar problems. VHF/UHF off the mirror, HF off of the Spare Tire rack.

Dang - you just keep making it harder.

The dipole is pretty good. You'll lose something to the polarization difference. I don't remember the number.

Do you have the vertical corner markers forward? Maybe you could do something with one of them.

Hi Dan,

How about something like the Hustler Model BBG-150 on an NMO mag mount stuck on the metal below the window level. It has a swivel ball that should allow you to bring the radiator near vertical while using a horizontal mount. Or just bend the whip on the antenna of your choice.
<http://www.new-tronics.com/main/html/mobile_nmo_150_models.html>

My APRS antenna is a Hustler LM?-144 5/8wave on lip mount on the hood of my car and I bring the coax in through the passenger door. Self stick anchors and wire ties keep the coax out of the way.

You will use an usb-to-serial adapter cable. There are different kinds
of them, and some have been told to work less good with the APRS type
of communication between the computer and the TNC (hear something
about Belkin).
The adapter cable should always use the same USB port in order to not
confuse your APRS software (they have told me).

Quite simple, you just need s USB<>RS232 converter.

They are not all created equal and some (particularly the very cheap ones) have problems with APRS. Google for one with an FTDI chipset, they are known to be good for amateur apps.

Did I ever suggest that you did have problems getting UIView to run? If you had trouble with APRSIS32, perhaps the problem was you are too full of how clever you think you are to ask for help in the group where you would certainly have received assistance.

As for the rest of your post, I think the group members can judge for themselves the value of your opinion. I couldn't care less whether you prefer to use a program that can never, ever be updated because its author is SK and chose not to release the source code. But as someone who has spent a lot of time writing software which has been given freely to other hams I speak from experience when I say that the attitude of people like you who lack the skill to create anything better but who still denigrate someone's best effort as "crap" make me feel "why the **** do I bother." And if the developer of APRSIS32 decided as a consequence of remarks made by people like you that there were better ways of spending his free time than continuing to develop his program APRS would be the poorer.

If I was moderator of this group I would ask you to apologise to Lynn for your description of his software as "crap" or I would ban you.

You'll need a USB to serial adapter to get to your KPC-3+. It's almost like a religion as to those that say one brand/chipset is better than another. I believe you're better served by making sure you can return whatever adapter you purchase if it doesn't work with your combination of hardware and software.

Julian,
I'm not going to argue with you. I stated my opinion. That opinion disagreed
with yours. That is all I have to say on the matter.

Actually you said confusing crap, that's not a review. Confusing crap why? Perhaps you could write a proper review. Like how easy it is to install the various APRS clients and how good the support is for each. What features one client has over another etc.

But I guess you won't.

I personally don't slag off people who write software for free, I encourage them, I use various software written by Amateurs. If I don't understand I ask, and if I think the software could do with something I ask if it could be included.

I fully support anyone writing software for the amateur community.

Steve,
My use of the word "crap" was wrong. I freely admit that and apologize for it. I would have done so earlier but others were having so much fun with it.
I am currently re-evaluating the software at Lynn's request and from what I am seeing I may have been a bit hasty with my criticism. I'm used to UIView and I'm comfortable with it.

I too appreciate software by Hams for Hams. I usually try it out and if I like it I pay for it. I use allot of it.

It is my hope that I eat no crow here, but if I find that I was wrong I will admit it and be man enough to eat some crow.

Until then,
Steve KA9MOT

Topic: 8170 Message: 8208

OK, I like it. I do find it more complicated then UIView, but I am used to UIView. I'll spend some time learning as much as I can about this new software and see where it takes me. It is working as well as UIView does, is smaller and faster.

So, I'll eat my Crow. I was wrong. Not to change the subject, but can I give you guys my opinion on those crappy Icom radios? :)

You think APRSIS32 is hard to run? Uh, ok then. Good luck with whatever you go with.

Yes,make sure you can return it! Try the ones people recommend. Do a search in here, and you will find brands people have verified. I bought a cheap China cable with the Prolific chip. Stay away.. They are a very design, and terrible drivers. They even sent me a replacement. It will make a good parts cable!

> You'll need a USB to serial adapter

And here's the most important information about getting one that will work:

Buy one that is Windows Logo Certified for use with the same OS that is installed on your computer. WindowsXP, Vista, Win7, whatever OS is on your computer, you want to see an express statement with the adapter that it is designed and certified to run with that OS.

Many that are not certified will often work, but the certification is only awarded after it has actually been tested and found to work pretty much all the time. Often the same price, sometimes a whole $5 more than the cheap stuff.

IBM and Keyspan are two of the brands that have invested in certification for a long time now.

How is APRSISCE as an I-Gate? Can you set PHG string settings and gate traffic to and from the Internet? How about TNC support in and out of Kiss mode?

Hi Dan,

After looking around a little, I found this accessory for the
Cascadia.
<http://www.walcottcb.com/cas1-freightliner-cascadia-antenna-mount-p-2062.html?sort=6a&page=1&cPath=28_353>
A little pricey, but pretty close to a no mod or at least
reversible installation.

The same has often been said in the Winlink forums. Not all the brands do work on all HW handshake pins. Often the reason some aplications work and others not. Keyspan has been mentioned as good.
Usually they say stay away from Belkin.

8224. SKYWARN Recognition Day

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-01 03:21:51 UTC
From: Lynn W. Deffenbaugh (Mr)
Topic: 8224 Message: 8224

This Saturday (December 4) is SKYWARN Recognition Day when amateur radio operators light up the airwaves from participating National Weather Service offices. See http://www.wrh.noaa.gov/mtr/hamradio/ for more information.

Since contacts via repeaters and EchoLink/IRLP are considered valid (this isn't really a formal contest, but an awareness event), then why not APRS contacts? To make an APRS contact, simply send an APRS message containing "CQ SKYWARN <additional text>" to "CQSRVR". This will send <additional text> to all those that have gone before and also subscribe you to receive all future CQs to SKYWARN for the next 12 hours. (See also http://www.aprs-is.net/CQSrvr.aspx)

I, for one, will be monitoring the SKYWARN CQ group on CQSRVR as long as I can starting Friday evening at 7:00pm Eastern (hopefully representing WX4MLB) until I hit the sack, and will again be monitoring all day Saturday from elsewhere. Send a CQ SKYWARN to CQSRVR and I'll get back to you when I can from wherever I am.

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile and Win32

PS. I'm already signed up on SKYWARN via CQSRVR, so feel free to send a message to test it before the contacts begin.

8225. Garmin Power Cable

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-01 23:57:08 UTC
From: ka6gdt
Topic: 8225 Message: 8225

I am currently using a Garmin 12 for my gps, TinyTrak4, and my TH-F6A. I found a cable for the Garmin 12 that charges and connects to the TT4 enabling me to use the gps without having to change batteries all the time. I also have a Garmin Nuvi 350 that I would like to use as well. I would like to find a similar cable that charges and connects to the 350 at the same time. Does anyone know where I could find a duel type cable similar to the cable used for the Garmin 12. When it's time to recharge the 350 I have to disconnect from the TT4 and charge the 350 then reconnect when charging is complete. I've looked around but have not come accross one as of yet. Anyone know where these might be found?

Thanks,

Dennis(KA6GDT)

Topic: 8165 Message: 8226

If the original poster or this question is driving a Cascadia (Freightliner), there should be a bar on the back of the cab. It looks like a big "grab handle" that is usually horizontally oriented. He could use that as the mounting point. I had both Freightliner Century and Peterbilt 387 models and there was spots you could conspicuously (sp.?) sneek a coax thru underneath the cab of the truck. If all else fails, he could loosen the "boot" around the gear shifter and feed it through there.

I used to run for a company out of Omaha, (4th largest trucking firm) and this is how I survived on the road. If he is just running VHF/UHF he could also do the "thru the glass" mount on the windshield. Not the best solution, but would work moderately well when parked at the truckstops. Generally speaking, if there's a truckstop, it most likely is going to be in a reasonably short distance from a city/town that has at least one repeater.

HF usage in a "hidden" install like he needs to do might present a few more challenges. Obviously it could be done, however, teardown if he is getting close to a terminal where he might be called in for service etc., at least a set-up that allows quick removal.

Subject: Re: [APRS] Re: Antenna mounting

Hi Dan,

How about something like the Hustler Model BBG-150 on an NMO
mag mount stuck on the metal below the window level. It has a
swivel ball that should allow you to bring the radiator near
vertical while using a horizontal mount. Or just bend the whip
on the antenna of your choice.
<http://www.new-tronics.com/main/html/mobile_nmo_150_models.html>

My APRS antenna is a Hustler LM?-144 5/8wave on lip mount on the
hood of my car and I bring the coax in through the passenger
door. Self stick anchors and wire ties keep the coax out of the
way.

You will use an usb-to-serial adapter cable. There are different kinds

of them, and some have been told to work less good with the APRS type

of communication between the computer and the TNC (hear something

about Belkin).

The adapter cable should always use the same USB port in order to not

confuse your APRS software (they have told me).

From: Dan Bowkley
Topic: 8165 Message: 8228

I used to drive a blue truck too, actually leased one for a while. 43878, 11636, and 12451.

I had thought about mounting to the bar back there and routing under the cab; only problem I see is that the antenna would be stuck between the back of the cab and the front of the trailer...both of which are sheets of metal. I'd think that not only would reception suck but the signal bouncing around between the two reflectors would do eeeevil things to my swr. I can't really go up, since I do run thru NYC sometimes and the cross Bronx really is 13'6", and...well really it seems the only way is out the side. Might be able to fab something that hooks to the cb mount on the side of the cab, but elegantly routing the cable then becomes a problem. Must say that mirror mount bracket is starting to sound better and better.

Would running an auto matcher to my cb antennas be really horribly bad? I'd think with the huge difference in frequency the cb antennas would basically act like a long wire, which can be matched....run the feed from the factory cb antennas into a diplexer and one end to my cb and the other to a matcher and then to my 2m. It's hideously ugly, electrically speaking, but it really is zero modification. Thoughts?

From: k7ybz
Topic: 8225 Message: 8230

You should be applying power to the rear of the 350 with the car adapter. That will also charge the internal battery. You can still plug the TT4 into the connector on the side of the 350. Data is only available on the side of the 350. The back connector is only for power.

Power out and power in on the side connector is dependent on the cable connected to it. Garmin uses a non-standard protocol by sensing the ID pin to put the 350 into certain modes. For example, to put the 350 into FMI mode, an 8.2K ohm resistor is on the ID pin to ground. In this mode, power from the 350 is supplied to the converter in the cable.

For the Garmin AC adapter, there is a 7.5K ohm resitor between the ID pin and V+ and another between the ID pin and V-.

8231. Help with APRS software

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-02 20:24:00 UTC
From: kd5pck
Topic: 8231 Message: 8231

Hello all,
I just purchased a new laptop and would liek to set up an APRS station at the house using it. It's running Windows 7, 64-bit. I plan to use a Kenwood D7A(g) that's just been collecting dust with this laptop. I am only about 6 miles from a digipeater. With a mag mount antenna, I can hit the repeater with no problem.
What I would like to know is what would be the easiest route to take when it comes to the software. I tried WinAPRS a few years back and kept getting error messages everytime I tried opening the program. I didn't have the time to research what was going on and it got put on the back burner. What should I go with?
I have been running APRS in my truck for about two years now but have really only been using it as a tracker. I want to do more with APRS than just looking at my route on a website.
If anyone can pass along any links to the APRS software and any maps I may need, that would be great.
Thanks in advance for any help.

8234. SKYWARN Recognition Day - Starts in 12 hours!

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-03 11:44:23 UTC
From: Lynn W. Deffenbaugh (Mr)
Topic: 8234 Message: 8234

A few of us have been warming up the SKYWARN group on CQSRVR so it's ready for the rest of you to join in! All you need to make APRS contacts is any APRS client and/or message-capable device to make world-wide contacts via APRS messaging.

See the instructions for CQSRVR at http://www.aprs-is.net/CQSrvr.aspx and use the SKYWARN group name. Remember to include some sort of greeting text after "CQ SKYWARN" and make sure you're in range of a bi-directional IGate!

Let the countdown begin! "See" you on the air...

(oh, and depending on your APRS interface, knowing the local temperature is as easy as glancing at the nearest APRS weather station!)

Copying my previous announcement message:

This Saturday (December 4) is SKYWARN Recognition Day when amateur radio operators light up the airwaves from participating National Weather Service offices. See http://www.wrh.noaa.gov/mtr/hamradio/ for more information.

Since contacts via repeaters and EchoLink/IRLP are considered valid (this isn't really a formal contest, but an awareness event), then why not APRS contacts? To make an APRS contact, simply send an APRS message containing "CQ SKYWARN <additional text>" to "CQSRVR". This will send <additional text> to all those that have gone before and also subscribe you to receive all future CQs to SKYWARN for the next 12 hours. (See also http://www.aprs-is.net/CQSrvr.aspx)

I, for one, will be monitoring the SKYWARN CQ group on CQSRVR as long as I can starting Friday evening at 7:00pm Eastern (hopefully representing WX4MLB) until I hit the sack, and will again be monitoring all day Saturday from elsewhere. Send a CQ SKYWARN to CQSRVR and I'll get back to you when I can from wherever I am.

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile and Win32

PS. I'm already signed up on SKYWARN via CQSRVR, so feel free to send a message to test it before the contacts begin.

Hi Scott,

I made my own cable, from memory it is a direct link between RS-232 and the radio.

I got the information off the web, might of even been DK-Mods that supplied the info.

Works well. I will see what I can find for you, might not happen today, have a Fire Fighting day at the station and will be away in the next 2hrs. See what I can do.

Kevin, ZL1KFM.

Lynn,
Will this cable interface between the radio and the laptop for use with the APRS software or is it just for programming the radio? Thanks.

Not being Lynn, I still know that the serial cable for TH-D7 for
configured for the PC connection will allow programming e.g. with the
Link700 program and it will allow you to use the TH-D7 with an APRS
application e.g. UI-View.

From: w7boz
Topic: 8243 Message: 8243

Hello Group,
I am going to get me a good USB to Serial adapter for Christmas. Problem is there are so many different brands out there. And I can not tell if they will work. So, what I would like to do is create a list to put in the files section. This seems to be a very common topic looking through the archives. If you have a USB to Serial cable that works, please email me the Brand, Model#, Operating System, and the Serail device(s) you use it with. Or if you know a good brand that works with everything, for a good price let me know where and how much.
Thanks, Kevin

This topic did the rounds a couple of weeks back, look for "New Laptop and APRS Help Needed" in the archive.

In short, anything using the FTDI chipset has been proven to work very well in all amateur applications, plus there were a couple of other recommendations in the thread.

There's only one pinout that I'm aware of for a D7 cable. It works for
NMEA GPS, Computer-based programming, and Computer access to the
internal TNC (for use by APRS software if the TNC is in PACKET mode).

Lynn (D) - KJ4ERJ - Not an expert on the matter though...

Ken, as long as you get one that is Windows Logo Certified to work with your specific OS (XP, Vista, 7, etc.) you should be fine.

The product should say something like "Designed for Windows XP" and bear a MS logo on the package. Somewhere on the MS web sites you'll also find the Hardware Qualification List (HCL) for your OS, and any device listed there has been tested and found to work 99-44/100ths percent of the time.

If it isn't certified to work with *your* OS, it doesn't matter if it worked under another one.

My old Belkin model would not work under Win 7 when my old PC (running XP) finally went to PC heaven. Belkin did not have any newer drivers for it. The unit that Byon is selling on the Byonics website works on every machine I have tried it on. One little-considered issue with USB to serial converters is that many will freak out and shut themselves off if they are exposed to relatively high RF fields, and I generally try to avoid that (I recommend turning the RF power down when programming Micro-Trak transmitters) but the brand that Byon has, has not even been affected by the RF from my 30 Watt experimental Micro-Traks. I have no idea what the brand or chipset is, but Byon can probably amplify on this.

"as long as you get one that is Windows Logo Certified to work with your specific OS"

Afraid this is not correct, as some adapters don't control the RTS/CTS or DSR/DTR lines correctly even though they have certified drivers (all that tells you is that money has been paid to Microsoft for them to verify the drivers don't mess with windows, not that it does what it should do with respect to the hardware).

If only it was that simple!

It means that an additional temperature sensor is the only thing
supported on the 1-wire bus. The rest of the sensors don't use 1-wire,
and eventually we'll add support for more 1-wire devices.

In the D72 I got, the SKYCOMMAND function also does not show up.
When I asekd the Kenwood Rep, he said you have to cut a diode to
get the SKYCOMMAND to show up, because it is still illegal in
some comntries and the radio apparently is shipped to countries
besides the USA. But in the USA, skycommand is legal and is a
very powerful capability.

Aftermarket gizmos can easily make the skycommand command ANY HF
radio (with serial interface) be commandable from the front
panel of the SKYCOMMAND HT's. Its neat, the HT display simply
shows the HF frequency and you tune it with the TUNE knob!

I think I got that all right. See my web page:
http://www.aprs.org/skycommand.html

If you ever want to interface directly to the internal TNC, right now
you need to go for the Kenwood. Is $150 worth it? How much would an
external TNC cost connected to the Yaesu? And are you willing to deal
with the extra cables, device, and power while mobile?

If you're content with a closed APRS HT that you cannot interface to an
external device without those cables, TNC, and power, then the Yaesu is
cheaper.

8258. Re: [APRS] TNC for Igate/Digi

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-06 04:28:32 UTC
From: Lynn W. Deffenbaugh (Mr)
Topic: 8256 Message: 8258

A KPC3+ with the latest ROMs has issues if operated for a long time in KISS mode. It begins to delay delivery of received packets out the serial port. Not a good thing to have happen on an unattended IGate/digi. (My son runs a KPC-3+ in his trunk as KJ4DXK-9)

The OT2m has the advantage of remote command execution, so you could actually reconfigure it remotely, provided you can communicate with it. However, it has a hardware decoder chip and as such cannot change beyond the modulation supported today. But it is also an open source platform, so you can possibly customize the firmware if you've got the programming skills. (My OT2m is KJ4ERJ-9 with another T2-135 as KJ4OVQ-9).

The TT4 is another option and is actually what I run as my KJ4ERJ-7/KJ4ERJ-1 IGate / W1 Digi with APRSIS32. With a DSP-based decoder, the TT4 firmware could be upgraded in the future to support new and/or different modulations. But it is a closed source platform, so you're at the mercy of what Byonics chooses to implement in the firmware.

There are trade-offs all around. I've tinkered with all platforms and they've all got their own strengths and weaknesses. I'm sure there are even other choices out there and other features or concerns with these three choices.

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile and Win32

> OT2m or a KPC3+.

I don't have any experience with the OT2m but own five KPC-3 or KPC-3+ TNCs. The KPC-3 (not plus) is still very serviceable. There are probably some advanced features not present in the plain KPC-3 but I don't believe anything that would effect an iGate and certainly nothing that will bother a Digipeater.

The <http://www.aprs.org/> site has text files that describe how to configure the KPC-3 family. My web site <http://www.n9puz.com/kpc3_update.html> has information on where you can go to update an older KPC-3 to have the latest ROM firmware which gives it most of the functionality of a KPC-3+.

A new KPC-3+ is around $200 in the US. Used KPC-3 (non-plus) frequently show up on sell/swap lists, hamfests, and auction web sites in the $40-$60 range.

I'm anxious to hear about opinions on the OT2m. I have not used one but they look like a good product.

8262. Looking for Easiest Digipeater Setup Possible

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-06 18:01:02 UTC
From: barry_keating
Topic: 8262 Message: 8262

Our local amateur radio club would like to install a digipeater to cover the local area and serve as a public service. While areas around us have digipeaters, our immediate local area is not covered,

We have a location, Internet connection, and tower with antenna. Those basic components are already in place.

We would like specific information about how to set up a very simple digipeater using an older laptop computer and a 2 meter mobile or HT rig.

Specifically what we would like are recommendations about:

1) software to use (UIVIEW?);
2) use of an actual TNC versus a "software" TNC;
3) cabling setup.

Are there any commercially available options that would make our setup easy?

We would like to get as close as possible to a "plug and play" option this first time around!

I highly recommend APRSIS for the software. It is new, user friendly, and although it is still in Beta, it is very stable and functional. It is in VERY active development.

Check http://groups.yahoo.com/group/aprsisce/ and for info.

Our local amateur radio club would like to install a digipeater to cover the local area and serve as a public service. While areas around us have digipeaters, our immediate local area is not covered,

We have a location, Internet connection, and tower with antenna. Those basic components are already in place.

We would like specific information about how to set up a very simple digipeater using an older laptop computer and a 2 meter mobile or HT rig.

Specifically what we would like are recommendations about:

1) software to use (UIVIEW?);
2) use of an actual TNC versus a "software" TNC;
3) cabling setup.

Are there any commercially available options that would make our setup easy?

We would like to get as close as possible to a "plug and play" option this first time around!

> Thanks, Kevin
>

Most usb adapters contains either FTDI or Prolific chipsets regardless
of the manufacturer.
Although I've had good luck with both, there are plenty of people who
will tell you FTDI based adapters work better. FTDI based adapters
tend to cost more.

If a cable does not specify what chipset it contains, simply do not
buy it. If you want to make a list, specifying chipset and driver
version combinations that work well would make better sense than a
list of manufacturer model numbers. There are only a handful of
actual chipsets vs. dozens (hundreds?) of different devices using
those chipsets.

An adapter that works perfectly with driver version 3.0 might become
unreliable with version 3.1. It may work fine on Windows but not so
fine on Mac. Both versions might work fine if you adjust a setting or
two in the driver. My point is that saying a specific adapter "works"
is not necessarily an accurate statement, and tracking all the various
permutations available would be a massive task.

Believe it or not, "try to get one that uses an FTDI chipset" is good
advice and about the best that can be done without making assumptions
that won't always hold true. In the end, most adapters work fine and
almost all can be made to work fine if you're willing to tweak some
settings.

A TinyTrak4, OT2m (Tracker2), or even a KPC-3+ can do standalone digipeating with just a radio. If you're not doing an IGate, you don't need the PC or the Internet connection. So, is it truly just a digi, or is it a Digi/IGate?

You can also read the APRSISCE Wiki at http://aprsisce.wikidot.com/ to get an idea of some of the supported functions. It will support any KISS-compatible TNC, so the hardware selection is still up to you.

HI Mike

Just checking Have you insured that you have not turned down the squelch,
if you are using a Kenwood station.. If squelch are open it will not TX.

Path should work as wide1-1,wide2-2

You might be in a tough place in order to get you data out. Not that many
digies around.

Just checking 144.800 would not happen to be a repeater area in US right ?
if so the radio could be running with default repeater spacing at that freq.

I didn't give specific models as I'm in the UK and there are a lot of OEM manufacturers which use the chipset, however a quick Google of "ftdi usb serial lead" brings up a load.

The specific is get the right chipset, that's the key to happy amateur RS232 system!

If they don't specify, don't trust it!

Jim-
"some adapters don't control the RTS/CTS or
DSR/DTR lines correctly even though they have certified drivers "

This is not about security certified DRIVERS but about logo certification of the HARDWARE ITSELF. Totally different certification.

An adapter which is logo certified MUST have passed tests that correctly exert control over all pins/pairs. If it was logo certified and listed on the HCL and still did not work--you probably had a defective piece of hardware, or other issue.

HCL certification does not mean everything will work in every possible configuration every time. It is possible the software being used to control the hardware was a problem, i.e. a newer version of "dot net" framework has been known to fubar everything on a computer, certified or not. Not to mention some USB ports do not supply the full 500mA current that they are required to supply, or all the other things that go bump in the night. HCL certification doesn't affect any of that, it just means the blame is almost certainly not on the certified component. (Not driver, but hardware component.)

The certification doesn't cover EVERYTHING. I've never seen the spec, but I'm pretty sure it doesn't cover things like how long it should take a device to switch baud rates or whether it'll drop a character while it does so. Latency also varies from device to device, depends on how the converter wants to pass data up to the host.

Almost every parameter of how data moves between host and device can
be adjusted to the needs of your application. Buffering, timeouts,
polling rates, etc are all variable on all the adapters I've worked
with (which is quite a few, as I write software that interfaces with
serial devices).

Many of the problems people run into with serial adapters are caused
by the default settings not matching their desired use. An adapter
set up to provide good throughput of bulk data at 480kbps just isn't
going to work so well when used at 4800bps for single bytes. It may
appear not to work at all when in fact there is nothing wrong with the
adapter, it's just doing what it's been told to do.
The USB bus makes it nearly impossible to have an adapter that works
well in all possible applications.

If you're the type who doesn't mind experimenting and changing some
settings, you will find that practically any adapter can work fine for
any application. If you want something that works out of the box,
stick with FTDI and avoid the higher speed (more than 230kbps) capable
devices if your intention is to use the thing at low speeds.

Say I'm in one part of the country or world and want my list to show only stations in another part of the world.

Example: I'm in France and I want to see who is moving in Seattle. Is there a way to set my radio to fill the beacon list only with Seattle stations, or pacific NW stations? If so, how?

Similar question... Is there a way to have the list display only specified call signs? I'd like to see who might be out and about and send them a msg. But my list is filling up only with French stations. That's also interesting but I'm looking for folk back home.

How might I go about getting that info, with a radio only (I.e. Not using a computer)

Hi

if you by radio mean by listening only on the aprs chanel like 144.800 in France, then the answer should be no.
The rf chanel can not carry all the position data and othere aprs info in the world.
For the us data to reach France would require that someone will gate traffic from US to france either via internet or HF. That can not be recommented as the data load would be killing the local france aprs chanel.

If you like to send messaged home then you either need to check that they are online using other tools or just send blind hoping it would make it.

One tool that could help you at home are the store and forward addin to uiview. The program look when on for any messaged adressed to that mailbox and forward the messaged to the specifyed ham, when the ham come online on APRS.

Simple with an APRS-IS range (r/lat/lon/dist) filter (http://www.aprs-is.net/javAPRSFilter.aspx).

> Example: I'm in France and I want to see who is moving in Seattle. Is there a way to set my radio to fill the beacon list only with Seattle stations, or pacific NW stations? If so, how?
>

Ah, on the radio, not so easy, in fact, nearly impossible. To see who is moving in Seattle when your radio is in France, you'd have to persuade some French IGate operator to gate all of the Seattle traffic to the local RF. Given that the RF channel on 2m is typically 1200 baud, I really don't think that's such a good idea....

> Similar question... Is there a way to have the list display only specified call signs? I'd like to see who might be out and about and send them a msg. But my list is filling up only with French stations. That's also interesting but I'm looking for folk back home.
>

Well, that would all depend on what radio you have. Every APRS radio is different, so you'd have to consult your radio's documentation to find out if it has the ability to filter the list. However, you can only filter and see what you're hearing, which will most likely not include the "folk back home".

> How might I go about getting that info, with a radio only (I.e. Not using a computer)
>

Well, you could do it with APRSISCE on a Windows Mobile Phone with an unlimited data plan tapping into APRS-IS, but that's not "radio only" although it could be argued that a WinMo phone isn't really a computer. But, given the discussion above, you're only going to see local traffic on RF unless you are actively messaging with someone via IGates near and far with the APRS-IS in between.

Not being familiar with the Store and Forward add-in, how does it (or does it even) mark the time-delayed message as having been delivered long after being sent? If I send a message to arrange a voice QSO via an EchoLink node, do I need to remember to time-stamp it or is the recipient somehow going to know that I sent it 6 hours ago even though s/he just received it when going online with APRS?

Hi Lynn

Good question

I believe that it do not time stamp, so it might not be the best for planning QSO..

You can find more info here http://www.apritch.myby.co.uk/uisf.htm.

I really like the feature, Could see that being extended to larger network, where the store and forward servers are communicating in larger scale, maybe with a global master server in between.

So when i send a messaged to my self via the Store and forward mailbox, i receive an ack.. The mailbox then put out an object saying that there are mail for OZ1BZJ-9.... When first beacon from OZ1BZJ-9 are heard it will send the messaged using the normal messaged function in UIview (retry 5 times) if messaged times out it will after some time and when an other beacon are heard from OZ1BZJ-9 send the messaged again until a ack are received.... (Neat feature for the future would be a expire date for the messaged)

Topic: 8243 Message: 8283

Scott, I'm sure the HCL doesn't cover everything. It is only meant to cover "most" things.

You'd have to contact MS to find out just what it covers regarding RS-232 ports, but I'd expect that for a device to be HCL listed, it has to conform to all RS-232 standards (that exists) and to conform to whatever standards exist for physical RS-232 serial ports on motherboards. Which is a more ambiguous target, considering there are millions of Dells and others that routinely have problems because they implement RS-232 at only 5 volts instead of 12, etc.

Over the last decade I've never heard a complaint that an HCL-listed emulator did not work. Only that "my serial port converter doesn't work" and when it was replaced by anything that was on the list--the problem was solved. Won't solve bad cables, bad devices, wrong baud rates or other problems, but when all you've got to go on is "the box", the box with the logo certification on it is extremely likely to function as it is has been certified to do.

Keyspan and IBM have had certified devices out for at least ten years. Belkin, only more recently. The older Belkin devices were often problematic.

Drivers and driver certification are a whole other issue that most Windows users are unaware of. NT5 (Windows2000) started a major MS program to include hardware drivers "for everything" in the OS itself. I think their goal was to support all hardware released within one year before that OS shipped, vaguely 2000 drivers bundled in. With XP (NT5.1) that number was pushed up to 5-10,000, IIRC. With Vista, the size of the distribution files is much larger, people complain, but there was another tenfold increase in the number of supplied drivers. Win7, I have no idea about the numbers any more.

The point being, if a device is on the HCL, the drivers probably are also already IN the OS, or the OS can fetch them, and the drivers will be functional as well, as part of that bundle.

Noting works for everyone, but this is the "Good Housekeeping Seal" for computer hardware. Its a good way to start.

> I own the D7(G) and living in the Metro NY...
> area makes it impossible to TX.... The point
> that I'm taking is that advertising APRS
> capability on an HT for most of us is not happening.

You are right that that has nothing to do with TX. The HT can hear everything that any other station can hear. The problem is that all the APRS folk around you are mind-locked into APRS as vehicle tracking only, and are not putting out any useful info for the other 99% who don't give a hoot where those guys are.

> Is your opinion that APRS with this HT is intended
> for base use having a good antenna or in a rural
> location.

The solution for HT's anywhwere and especially in dense APRS area is to have APRS folk put up digi-receivers on 144.99 that listen for HT's only with NO congestion. THen any HT gets in easily by just operating 144.39 +600 (if available in your area).

> it appears to me that a steady stream of positions
> is taking away the intended purpose of APRS, and
> [blocks] ... emergency ... Portable

So true. Even the POSITION folks don't get it. APRS was NEVER for maintaing accurate TRACKS on people. There is NO WAY for 400 local commuters to share a single 1200 baud channel, NOT EVEN 10. The point of APRS POSITIONS is simply for showing WHERE someone is in the APRS network for the purpose of COMMUNICATIONS. It is NOT for TRACKING!!!!

But all those trackers, and egos and high rates and peg-every-turn applications kill the channel for everyone else. Sure, high rate tracking has a value at special events. BUT NOT FOR ROUTINE COMMUTING!

Spread the word!

Bob, WB4APR

That's an internet game.

> Is there a way to set my radio to fill the beacon
> list only with Seattle stations, or pacific NW
> stations? If so, how?

Thank goodness there is no way to spew such a burden onto a 1200 baud channel!
(though you can do it on you own private frequency if you want to, but not the common shared national channel, please.

> Similar question... Is there a way to have
> the list display only specified call signs?
> I'd like to see who might be out and about
> and send them a msg. But my list is filling
> up only with French stations. That's also
> interesting but I'm looking for folk back home.

If you want to see your friend in another country. Simply send him a message. If the Igates see the message, thent he Igates are supposed to send you HIS position report. Problem is that far too many people do not undestand how to set up an Igate and think that it should be 1-way. Thus they deny their local area the global connectivity that the APRS-IS is supposed to provide to the mobile RF operator. Sure, the internet couch-potatos see everything, but one-way igates break APRS functionality for the mobiles.

> How might I go about getting that info, with
> a radio only (I.e. Not using a computer

Send a message. If the ACK or REPLY that you can see on any of the internet sites by looking at your messages is not getting to your radio, contact your local Igate operator and ask why he is running a 1-way igate. Of course, you need to be within 1 hop (the same digis) as the local Igate or the probabilities are too low for messaging and acks.

8286. THD72 and VX8GR demo NewHaven CT

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-08 14:07:19 UTC
From: Robert Bruninga
Topic: 8286 Message: 8286

New Haven CT, Saturday.

Demo of APRS radios D72, D710, VX8Gr, VX8DR, FMT350.

I'll be in New Haven on Saturday with a few hours of free time
and can play radio if there is anyone nearby that wants some
hands-on time with these radios. Time and Place TBD. Morning,
noon or afternoon?

Bob, WB4APR
[PS, W1GXT are you here?]

Hi,

The TH-D72 looks like bulky compared to the Yaesus, if you have a chance to take a picture with both HT's side by side this would be great !

Tahnsk,

I also love the Store and Forward add on for UI-View. I just wish that someone could set up an APRS-IS Message Server. You would send an APRS message to the server addressed to the person with the message. Much like an Email. The server would then monitor APRS traffic and listen for that call sign. When the server hears that callsign it sends the stored message to the person. I personaly have missed numerous messages because I was "not in service". I am sure it would take a lot to do, but would be awsome to have. Kind of lke Yahoo messenger, you get the message when you log back in. Just a thought.

Well if someone can tell me how to get this Prolific cable to work I would be very happy. The seller even sent me a replacement because I can't get it to work. I even tore one apart to see just what chip it had. Just a blob of Epoxy over some chip. PCB was labled CJ1015-O2D.
If that means anything. I run WinXP and have tried every driver I could find. So I guess I will just go down to a "Best Buy" and buy a cable that looks good. And hope they take returns if it don't.

APRSISCE/32 does this automatically internally with no outside assistance (http://aprsisce.wikidot.com/message-retries)

Basically, it goes through a first set of decaying retries to deliver the message. It then waits in the outbox until the next time it hears a packet from the station. At that time, it enters a new set of decaying retries attempting to deliver the message. I will say it works well if the issue is a station that cleared or went out of range just as you sent a message. It doesn't work worth a hill of beans for a station that's driving around or into range of a receive-only IGate.

Oh, and you have to keep your copy of APRSISCE/32 open and active for these retries to work. But then, we all keep our base APRS stations active 24x7 anyway, right? But at least you don't have to consciously send the message through a 3rd party server, just send it to the station and let APRSISCE/32 do the rest.

There's a lot that has to work for APRS messages to deliver. As a refresher, check out http://aprsisce.wikidot.com/aprs-messaging-explained

The current APRS system is TDMA.

All stations are transmitting on the same frequency at different times. When all the time slots are full, they are full. Drat, foiled again by the laws of physics.

There are only two ways to improve the situation, shorter messages or faster bit rates.

You might want to go to their website and poke around for the different drivers. I know the first time I loaded the driver for the cable, Microsoft loaded a driver that didn't work. With 30+ years in the computer field I kind of knew what might be wrong, so poked around on their Asian site and found the driver for Vista. When I reloaded my laptop with Win 7 Ultimate. I went back to their site and downloaded the correct driver before even plugging the cable in and got it right the first shot, so I bet you can solve your problem with the correct driver. Good luck.

I agree with this. People need to stop buying the cheapest adapters and just stick with the more expensive ones like the Keyspan. Far fewer headaches and a lot of support from the company if something goes wrong. I use several Keyspan adapters for various personal and laboratory equipment. The lab equipment wants all the control signals, too, and Keyspan provides that. One of my adapters is actually a four-port serial cluster to a single USB, works fantastic and I never have to worry about the ports renumbering themselves because I plugged into a different USB port.

You are correct, of course. I was thinking CSMA/CD - Carrier Sense,
Multiple Access, with Collision Detection, but APRS doesn't really have
the /CD.. So, I should have said CSMA, not CDMA.

I have not seen anywhere any details of what you have and have not done. However, just plugging a USB-to-serial adapter and expecting it to work is just a touch optimistic. You still have to match the COM port in the software to the COM port the adapter is using. The default COM port selected by the adapter driver when first plugged in is the first number after the highest currently used by the computer. For example, I do not have COM1 through COM4 used, but I have an IR port on COM5. My USB-to-serial adapter chose COM6 and registered that to the system. From then on anytime that adapter is plugged in it will take COM6 regardless of the USB port the device is plugged into.

Try this: Plug the adapter into your computer. Right click on the computer Icon on your Desktop..Click on "Properties".
When the Properties Window opens, click on "Hardware" then click on Device Manager. Expand the "Com and LPT" ports. You should see your USB device and the COM port it chose. Match that COM port in your software and you should be good to go. One caveat. Some software developers did not think about having more than four COM ports to select from (A hold over from early DOS days). In that case, you may have to change the COM port used by the adapter. Keyspan has a utility for their adapters but the cheap boys do not and changing the port will be a little more involved.

BTW. I only use and specify Keyspan adapters for a list of reasons I won't get into here. Just suffice it to say that after testing dozens of devices with various software and hardware, the Keyspan adapters had by far they fewest problems.

Here is a link to G4HFQ's page that has links to Prolific drivers that are supposed to work and a recommendation for an FTDI based cable available from Mouser.

Good evening to all.

I have put together a Peet Bros Ultimeter 800 and KPC3 I wanted to setup remote weather stations that I could see on my D700. The station is up I see the weather on ARPS.FI. when I go to my truck it shows my wx station as a stationary not as weather and I dont see any data from the weather station.

The whole idea here was to 1. find a weather station that would integrate with the TNC. 2. setup at the tower site to allow folks access to the weather data.

I thought it was going to be simple. I didn't want to have to setup a laptop at the site to control the weather station and parse the data out locally to the TNC.

any thoughts ?

From: kevin asato
Topic: 8243 Message: 8305

I use a USB to Serial Adapter with Prolific drivers in exactly that manner (price of the Prolific adapter was right at Fry's - cheap). I also have to do this with a Bluetooth dongle by Linksys. The only time I can maintain a particular comm port assignment is when rebooting with the USB dongle plugged into the port. Otherwise, the port is marked "In Use" and the next higher available port number is assigned. I then have to force a comm port assignment from the Control Panel. I use the USB to Serial Adapter and the Bluetooth dongle for serial applications on routers, my KAM, and other telecommunications devices.

A quick web search reveals that your adapter uses the Prolific Pl-2303 chip. This is a popular, low cost chip used in many adapters. These usually work well but may need a setting or two adjusted depending on your application.

By "trying every driver you could find", you have had made the situation more complicated than it needs to be. I'd be happy to help you sort things out, feel free to email me directly. To start, it would help to know what exactly isn't working.

Spending more on your adapter is not a magic bullet. The Keyspan adapters are pretty average, with reviews ranging from "Best of the Best!" to "Garbage" (http://www.newegg.com/Product/Product.aspx?Item=N82E16812999081 for example)

Good support from the manufacturer is an important point, and probably one of the few metrics that can be used to recommend one brand over another.

From: craiginhouston
Topic: 8288 Message: 8308

APRS is an asynchronous TDMA system and AIS is a synchronous TDMA system with time slots.

For anyone not familiar with AIS its worth a look.

The maritime industry has developed a system similar to APRS but for all large ships at sea to broadcast their GPS location for collision avoidance. They took two old ship-to-shore radiotelephone channels (161.975 and 162.025 MHz) and re-allocated them for use with the AIS 9600 baud location beacon system.

If you live near the coast you should give it a try.

here are some links with more details

http://en.wikipedia.org/wiki/Automatic_Identification_System
http://www.navcen.uscg.gov/?pageName=AIS

You can purchase software for around $30 that turns your windows computer and sound card into an AIS data decoder. All you need is a ham rig that can tune 161.975 MHz FM and has a 9600 baud packet connector on the back to connect to your computer sound card. The link to this software is here

http://www.coaa.co.uk/shipplotter.htm

If you want to buy a complete receiver and decoder then I recommend you take a look at the SR-161 for $189

http://www.milltechmarine.com/Smart-Radio-SR161-AIS-Receiver_p_167.html

Or you can get a USB receiver at this link

http://www.milltechmarine.com/Comar-AIS-2-USB-AIS-Receiver_p_149.html

I would love to see someone convert the frequency of standard AIS transceivers to the ham 220 MHz band for use as a ham radiolocation and messaging system. Maybe Bob Bruninga can leverage some of his many talents to help make this happen?

Actually you don't need to buy anything if you already have a ham rig with a 9600 data port.
(I use a FT-7100 & 3 free programs), AISMON is a interface program that connects your soundcard to
a serial port, real or emulated, & Com Emulator, from Mix-W site, will create the 2 ports we need to
connect to "SeaClear2" a marine nav program very similar to APRS, it can RX from 3 ports & 1 is TX
capable, so a gps can also be attached, or dead-reconing can be used, along with a bunch of chartplotters etc
On my laptop I use a USB 5.1 sound box with line input & it works real well.
AISMON is available from it's Yahoo group while SEACLEAR is on it's own web site, Google it ,
& also has a Yahoo group called SEACLEAR MAPPING.
AISMON can also output to UDP-IP port & that is seen on sites like APRS.fi if anyone was wondering how all
those ships got there.

Subject: {Disarmed} [APRS] Re: Any Ideas on a TDMA type APRS

APRS is an asynchronous TDMA system and AIS is a synchronous TDMA system with time slots.

For anyone not familiar with AIS its worth a look.

The maritime industry has developed a system similar to APRS but for all large ships at sea to broadcast their GPS location for collision avoidance. They took two old ship-to-shore radiotelephone channels (161.975 and 162.025 MHz) and re-allocated them for use with the AIS 9600 baud location beacon system.

If you live near the coast you should give it a try.

here are some links with more details

http://en.wikipedia.org/wiki/Automatic_Identification_System
http://www.navcen.uscg.gov/?pageName=AIS

You can purchase software for around $30 that turns your windows computer and sound card into an AIS data decoder. All you need is a ham rig that can tune 161.975 MHz FM and has a 9600 baud packet connector on the back to connect to your computer sound card. The link to this software is here

http://www.coaa.co.uk/shipplotter.htm

If you want to buy a complete receiver and decoder then I recommend you take a look at the SR-161 for $189

http://www.milltechmarine.com/Smart-Radio-SR161-AIS-Receiver_p_167.html

Or you can get a USB receiver at this link

http://www.milltechmarine.com/Comar-AIS-2-USB-AIS-Receiver_p_149.html

I would love to see someone convert the frequency of standard AIS transceivers to the ham 220 MHz band for use as a ham radiolocation and messaging system. Maybe Bob Bruninga can leverage some of his many talents to help make this happen?

Do you adjust your modulation correctly ??

The trick to correctly adjust modem, it the 2200hz tone must be at same level of the 1200hz (at receiver side). Check with a scope on another receiver and increase modulation until you see 1200hz become bigger than the 2200hz, adjust for tone of equal amplitude.

When increasing modulation, the 2200hz tone pass through pre-emphasis(boost high frequency), he hit first the deviation limiter (at 5khz) but 1200hz continue to grown after. On receiver, with a over-modulated packet, the tone level become very unequal and very hard to decode for modem.

Voice can reach further through worse conditions than APRS or many other digital modes. The human ear can fill in many blanks in a voice QSO, but APRS needs to receive every single bit correctly or the entire packet is ignored.

Some other digital modes, especially those designed for HF, build in redundancy and error correction, but that usually introduces overhead, delays, and slower throughput.

That is why the Range circles in APRS default to HALF of the predicted RF range. A mobile typically goes through 30 dB fades while moving. As long as there is 30 dB excess signal, then digital works. Voice can still be understood through some significant fading. So rule of thumb is that packet has about half the range of voice (if moving)...

>
> Good support from the manufacturer is an important point, and probably one of the few metrics that can be used to recommend one brand over another.

It may not be a magic bullet but it gets you closer to a working solution. The cheapest device out there also likely means that the engineering time spent on it was poor or non-existent and support will be absent completely. Many of the manufacturers of the super cheap adapters simply use the base reference design of the chipset manufacturer and make no modifications to it resulting frequently in a less than optimal design. Spending a bit more usually gives you some more engineering bench time, better drivers, etc.

Given my experiences with multiple Keyspans plus other less expensive adapters I would be inclined to believe that the 'garbage' reports came from people that weren't doing what they were supposed to do by installing Keyspans' drivers as described or trying someone else's drivers like they would for a cheaper adapter.

For those that don't know, a reference design is a prototype made by a chip OEM that highlights every single possible feature and application of the chip they made. Some of the features may not be necessary in the final design so it just becomes a waste if it's implemented in a mass produced device. For example, aybe the chip has a battery monitor built in but the final design only plugs into the wall. If I enable the battery monitor then I consume onboard CPU time to monitor a battery that doesn't exist and slow down other features of the chip in the process.

8327. Re: [APRS] APRS Newest Software is???

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-11 00:18:30 UTC
From: Dennis Harriss
Topic: 8320 Message: 8327

Had the same problem. The way to get it going is to right click on the
.exe file and than click run and it will take off.

8328. Re: Store/Forward time delay (was: Is there a way to filter APRS list, by location?)

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-12 10:16:44 UTC
From: w7boz
Topic: 8276 Message: 8328

That is kind of my point.... You have to keep the program running. What if you are a mobile station? Or using the phone and turn it off. Or your computer locks up or dies and all the messages you recieved while you were away are now gone without a trace?
Just saying a server would be nice is all. :)

You would send an APRS message to the server addressed to the person with the message. Much like an Email. The server would then monitor APRS traffic and listen for that call sign. When the server hears that callsign it sends the stored message to the person. I personaly have missed numerous messages because I was "not in service". I am sure it would take a lot to do, but would be awsome to have. Kind of lke Yahoo messenger, you get the message when you log back in. Just a thought.

From: w7boz
Topic: 8243 Message: 8329

Ok, so I have someone that is going to help with the Prolific cable. I bought it only because it was cheap and I have never had any problems with cheap cables... Had no idea these things where so different. Guess I will try a Keyspan if this don't work
Thanks everyone for the feedback. Also going to try the drivers that were suggested in a link and will post if they work.
Thanks, Kevin

> >
> > I agree with this. People need to stop buying the cheapest adapters and just stick with the more expensive ones like the Keyspan. Far fewer headaches and a lot of support from the company if something goes wrong. I use several Keyspan adapters for various personal and laboratory equipment. The lab equipment wants all the control signals, too, and Keyspan provides that. One of my adapters is actually a four-port serial cluster to a single USB, works fantastic and I never have to worry about the ports renumbering themselves because I plugged into a different USB port.

8330. Freq, Tone and Offset in APRS Message

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-12 19:49:30 UTC
From: ipscone
Topic: 8330 Message: 8330

I'm not sure where this should be posted. At first I thought the problem was with my radio. But I have two different radios from two different manufacturers and they both work the same.

In many new radios, one can include their monitoring frequency in the outgoing Beacon Status Text. This includes one or all of these: Freq, Tone, Offset.

This allows people to know which frequency another station can be contacted on. However, I'm confused about what is actually sent out. For instance this is the REAL data for a repeater I use:

Input Freq: 449.700MHz
Output Freq: 444.700MHz
Tone: 103.5
Offset: Obviously 5 MHz

When I included: Freq, Tone, Offset in the Beacon Message, this is what is sent: 444.700 T103 +500

Why +500? It's not 500 of anything. I would expect: 5 (for 5 MHz) OR 5,000 (for KHz) but never +500.

This is the same on my Yaesu FT-350 and my Kenwood D72. When I check APRS.FI it shows up as +500. When I'm monitoring VHF with a 600KHz offset, it shows up as + or - 060.

Is there some strange convention that I'm not understanding?

8332. Re: [APRS] Freq, Tone and Offset in APRS Message

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-13 05:21:44 UTC
From: Bob Bruninga
Topic: 8330 Message: 8332

Yes, it was only a 4 character field, but we wanted to be able to program offsets over 1 MHz, so we made the field be in 10's of kHz. So 500 is 5000 KHz. Later we realized how confusing that would be to human raeaders and proposed that a following "0" could be added though the spec would not read it. But Im not sure it ever got adopted.

8333. OpenTracker USB released

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-15 22:01:24 UTC
From: Scott Miller
Topic: 8333 Message: 8333

I'm pleased to announce that the new OpenTracker USB is now shipping!

https://www.argentdata.com/catalog/product_info.php?products_id=148
http://wiki.argentdata.com/index.php/OpenTracker_USB

The new tracker is basically a Tracker2 without the digipeater and
Garmin protocol functions, but with a full-speed USB port that can be
used for configuration, command prompt access, and KISS mode,
independent of the two regular serial ports.

This means you get remote control capability, a TNC2-style command
prompt, scripting, weather station support, KISS mode, and the ability
to do all of this simultaneously without reloading the firmware.

There's also space inside for a GT-525 GPS receiver module, and we'll be
offering that with the appropriate jumper a little later as an option.

Demodulation is software-based, and significantly improved over the
OpenTracker+ - in our testing, it's been very close to MX614-based TNCs
in decode performance.

Because of the surface mount construction we won't be offering this one
as a kit. We'll still be offering the OpenTracker+ as a kit as long as
we're able to get the parts, but the assembled version will be phased
out in favor of the new design.

USB support has been tested with Windows 2000/XP, Mac OS X, and Linux.
We'll be adding INF files for Vista and Windows 7 shortly, but it shows
up as a generic USB CDC device so drivers are included with the
operating system.

Documentation is still sparse, but the wiki has the critical
information. Nearly all of the information in the Tracker2 manual
applies, with the exception of the digipeater and Garmin sections. The
OTUSB manual should be published by this weekend.

We've got units ready to ship now, and more on the way, so there's still
time to put it on your Christmas list!

73,

Scott

8334. Re: [opentracker] OpenTracker USB released

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-16 04:16:17 UTC
From: Scott Miller
Topic: 8334 Message: 8334

The OT1+ has never had particularly strong RX capability. It was
something I managed to add on when I upgraded from the old KX8 processor.

When I have time, I'm going to see if the OTUSB's demodulator can be
back-ported to the OT1+. It's going to be a bit of a stretch, though -
the OTUSB is clocked 3.25 times faster than the OT1+.

I've been getting results of over 930 packets decoded on the WA8LMF test
track, compared to about 960 for the MX614-based OT2m and under 900 for
most TNC2 clones. The biggest limitation is dynamic range, since it's
using mostly 8-bit math. You have to make sure the audio level is
adjusted properly, but there's a display in the diagnostic screen for
that. I'm going to add a simple AGC function later on - that helped
with the DTMF decoding on the ADS-SR1. Incidentally, that runs on a
slightly slower version of the same processor, so at some point I'll
probably port the DTMF code over and use it for some non-APRS stuff with
the OTUSB hardware.

The new MCU also has more RAM available, and part of that's going to go
to KISS buffering.

I'm really looking forward to doing a few more specialized board layouts
based on the OTUSB. Aside from the voltage regulator there's just one
44-pin IC that does everything, USB interface included. Some of the
software work was a major pain - getting it to load firmware over the
USB port when a good chunk of that firmware is the USB stack itself, for
example - but it does make the hardware side easier.

8335. Re: [opentracker] OpenTracker USB released

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-16 04:25:54 UTC
From: ray@rayvaughan.com
Topic: 8334 Message: 8335

Any hope for an Ethernet version some day? So much more flexible. The radio could be anywhere in the world with a hardwire or WiFi connection. PoE could even power the device, and a low wattage radio.

Ray, KD4BBM

8336. Re: [opentracker] OpenTracker USB released

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-16 04:53:44 UTC
From: Scott Miller
Topic: 8334 Message: 8336

It's on my bench now - just an eval board and a few thousand lines of code so far, but a first attempt at a board layout is in the works. Anything like a functioning beta version is at least 6 months out.

512 KB flash, 576 KB SRAM, minimum 4 MB serial flash, USB host/device support, SD/MMC slot... it's going to be a lot less confining system to program for! =] Also, with a 24 MHz 8-bit MCU already nearly matching an MX614 for decode performance, I'm really looking forward to seeing what I can do at 76 MIPS with a 32-bit MCU that's got some DSP instructions.

WiFi isn't in the works immediately. I'm trying to design the board with expansion modules in mind, though. Until then, you'd have to use a WiFi bridge.

It won't be quite as miserly with power as the T2, of course. I think the Ethernet section alone draws something like 500 mA @ 3.3v.

POE would be nice, but also might have to wait. Power distribution will already be much more complicated than the T2, with more voltages and higher currents, and considerations like having to be able to shut down some peripherals when in USB bus-powered mode.

8337. What TNC's can do 9600 both encode and decode ?

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-16 11:51:55 UTC
From: ml41782
Topic: 8337 Message: 8337

What TNC's are out there beside Kantronics that can encode and decode at 9600 ? I know there are some that can decode only at that speed.

Make that two supporting Ethernet. I typically use Comtrol boxes everywhere now.

I did order an OTUSB to play with.

Hi Scott,
Speaking of releases, what is the status of the ADS-WS1 weather station?
We have had one on order for a month now.

It sounds like a very exciting platform! Lots of things are going to be
possible in this.

If 3G and 4G continue to come down in cost, it might even become a
node-in-a-box. There are already a lot of cheap hotspots with WiFi on the
market. At a remote site, a phone line with DSL versus a low cost 3G account...
they're getting closer in price.

Hi Wayne,

We've still got a pile of back orders, but we're making progress. I think we'll be caught up in a few days.

After that, it's going to be a long wait for more. SparkFun cleaned out our stock of the wind/rain sensor assemblies so we ran out about two months sooner than expected. Hopefully the new batch will ship before the Chinese new year.

Sorry for the delay!

I'd have to agree. I am very new to APRS and I am still trying to figure all of this out. I still don't know what many of the terms mean. I installed APRSIS32 on my Windows 7 64-bit laptop and it was up and running in minutes. I emailed Lynn for a password and he responded within 10 minutes.

I put the pics of it on the TH-D72 group

8346. Digi repair

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-18 19:23:36 UTC
From: Jeffrey Sikora
Topic: 8346 Message: 8346

OK I am looking for some help. So our digi has went down and I found the issue, but want to change into the new commands while I have it at my house.

This is the display from the current KPC-3. What needs to be changed ? I downloaded hundreds of documents but cannot figure out what really needs changed other than pull out wide,relay stuff. Any help would be great.

Jeff

8347. RE: [APRS] Digi repair

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-18 19:49:07 UTC
From: Adam Mahnke
Topic: 8346 Message: 8347

Jeff,

Here are the settings that were changed from default on KC2ANT-1 which is running a KPC3+. As far as I know everything else is default after doing a reset on the TNC.

You'll see that I have BText filled in for the local repeater object of the 146.97 repeater.

I don't have the file for W2CXM handy or I'd give you that one as well.

This is what I came up with after reading the documentation from Bob's WB4APR website, and then doing some tweaking for my local machines. I maintain KC2ANT-1, AF2A (currently off air for radio issues) and W2CXM Digipeaters.

If you want me to pull the full list of everything on the TNC let me know and I'll go pull it from the TNC and give you the whole thing.

Good luck,
Adam

8349. Trouble with APRSLink

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-19 02:40:32 UTC
From: Al
Topic: 8349 Message: 8349

Trying to work with APRSLink. I sent a "H" to WLNK-1, but get no reply to my D710. I drove all over north eastern Pennsylvania hitting many DIGIs with the same result.

Upon arriving home I checked FINDU.com and saw that Winlink had been answering me but the responses never got to my rig. I was beaconing sucessfully so the system knew where I was.

Any ideas?

Are the Igates two way? Try sending "L" to see if you have any messages. But if there are no two way Igates your info will not be returned to you.

Please update it to New-N paradigm and with LOCAL INFO.

Here's how: Please see www.aprs.org/fix14439.html for exact details, but here is what you are looking for.

> 2 EVERY 00:30:00 STARTING AT 00:03:00
> 3 EVERY 00:10:00 STARTING AT 00:05:00
> 4 EVERY 01:10:00 STARTING AT 00:07:00

All of the above are direct only, every 10 minutes, except the 30 minute digipeter ID.

> BTEXT <== put one of your locally recommended voice repeater FREQ objects here. And 2 more in the LTEXTS

> HID OFF <== GOod!
> LT
>1 !4256.73NT07601.65W#PHG5750 Wilderness SAR-SYRACUSE DIGI
>2 !4256.73NT07601.65W#PHG5750 Wilderness SAR-SYRACUSE DIGI
>3 !4256.73NT07601.65W#PHG5750 Wilderness SAR-SYRACUSE DIGI
>4 !4256.73NT07601.65W#PHG5750 Wilderness SAR-SYRACUSE DIGI

Only the first 2 of these for the digi, one every 10 minutes direct, and the other every 30 minutes via 2 hops. The last two are for other FREQ objects. Please see www.aprs.org/localinfo.html

>LTP
>1 APK383 <= no hops
>2 APK383 VIA WIDE2-2 Only the 30 min digi packet 2 hops
>3 APK383 <= no hops
>4 APK383 <= no h ops
All the others DIRECT, no hops. Of course APK383 assumes this is version 8.3?

> RTEXT <==YOu need your password here...
> UNPROTO APK383 <= direct, no hops for the freq object
> UIDIGI <not needed unless this is an 8.2 ROM
> UIDWAIT OFF
> UIFLOOD SS,30,ID <= where SS is your state or SSS section
> UITRACE WIDE,30
> XMITLVL 100 <= that is default, It should be adjusted for optimum TX levels. The default cannot possibly be the correct setting unles you are extremely lucky.. Otherwise, you are overdriving the TX modulator and causing skew and distortion

Hop[e that helps. But these are from memory. Please check the web pages to get them exactly right.

But it is the local info that is important.

8352. Re: [APRS] Digi repair (nightmare)

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-19 04:56:57 UTC
From: Bob Bruninga
Topic: 8346 Message: 8352

I am so glad you are changing these! These settings below are the worst nightmare of QRM generator that could QRM hundreds of digipeaters over dozens of east coast states if this were on the east coast states!
Unbelievable!

>1 EVERY 00:15:00
>2 EVERY 00:29:00
>3 EVERY 01:00:00 STARTING AT 00:01:00
>4 EVERY 01:00:00 STARTING AT 00:31:00
>1 APRS VIA WIDE,WIDE,WIDE
>2 APRS VIA WIDE,TRACE,WIDE,TRACE
>3 APRS VIA WIDE,WIDE,WIDE
>4 APRS VIA WIDE,TRACE,WIDE,TRACE

Please, if anyone knows of any other digis with these worst-case settings please lets get them fixed. These max-QRM spammers were all supposed to be eradicated back in 2004.

It seems that there isn't a 2 way Igate near me. I do not get any messages except for ones sent by local stations.

I'm thinking about running an Igate in conjunction with my W3CE-3 Digi. What Igate software is available to accomplish this (Windows or Linux). I know UI-View can do this but it is getting rather old at this time. Any newer packages available?

My Digi is now running with a KPC3+ in stand alone mode.

Be sure to set it up for 2-way messaging!
The presence of RX only Igates undermining the integrity of
APRS... Without 2 way, people cannot get their messages.

Everyone needs to help us fix APRS where it is broken by 1 way RX only Igates...

It is easy to check on FINDU.COM or APRS.FI. Just look at your path and you can see what Igate heard you. You actually have one of your own stations on the internet W6VMS-10. Is it not an igate?

Your HT and Home get in thgouth KB4TYE. Ask him if his Igate is properly set up for 2-way messageing?

And your mobile got in through W4DEX-9 via AC4RF-3

My area is fine, I think some attribution got messed up somewhere along the way. I mentioned Xastir to the original poster and suggested to him to set it up as a two way iGate.

W6VMS-10 has both RF and Internet, I'm still experimenting with it, but the plan is for it to be a two way iGate.

KB4TYE seems to be properly set up for two way gating, judging from results while testing.

Hi Kevin,

If you are an ARRL member, go to the ARRL website and under technology, you can search for a review by manufacturer. They have a review of the PKT-1 in their November 1985 issue:

http://www.arrl.org/reviews-listed-by-manufacturer

Also, you can contact Timewave, the company that bought out AEA. It's my understanding that they have manuals for most of the original AEA equipment:

http://www.timewave.com/contact.html

I emailed Timewave's tech support with questions about the AEA PK-232MBX and they responded the next day, very nice guys.

8363. Xastir 1.9.9/Linux Map Help Needed

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-21 22:46:36 UTC
From: k6acj
Topic: 8363 Message: 8363

I need help with the maps as delivered with Xastir V1.9.9 for Linux. I'm running Ubuntu Desktop 10.10 here. Only the world map displays and the others in the map chooser list don't appear when highlighted and 'ok'. Now after setting up the igate for AREA, the world map outline disappeared. When ever I complete Map Chooser and close the lower left of my screen says 'loading weather alert maps'.

I have a lot of experience with WinAPRS and Tiger maps but the experience isn't helping with Xastir.

Also, maybe I'm missing something but I would like to implement my collection of tiger map zip files that worked fine with WinAPRS. Any help to get those up and running is appreciated.

Any pointers ??? Bill K6ACJ in DM03 Southern California

8365. Peet Bro's weather station APRS help

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-22 00:03:57 UTC
From: newradiotech
Topic: 8365 Message: 8365

I am having trouble with my weather station and WXtrack from Byonics I can not get the weather station to key the radio. I have checked all the settings 10 times and the WX track alone will key the radio but when I put the weather station in APRS mode it will not make the radio TX any ideas. I can test the WX track into my service monitor and its fine so I think the problem is the weather station thanks for all the help.

KC7JLU thanks

8366. what rig for 30 meters?

From: Josh Housey
Topic: 8342 Message: 8366

There are many choices and just about any of them will work for 30m APRS. It generally doesn't have to be fancy with features. I will say that I started using a Alinco DX-70T and I don't recommend that one. That is because it was only able to tune up to the tenth of a hertz and it was difficult to "exactly" lock on to stations (Example, it would only tune and show 10.147.6 USB or 10.151.0 LSB). I went out and considered alternatives and decided on the cheap route with the Icom IC-718. My other choice (at the time) was a a Kenwood TS-570. I have had the Icom in the service with a KAM+ for many years there and has been working quite well.

Compiling programs is more of a stigma that it is difficult, it's fairly automated. Follow the directions, especially which commands you run as root and you will be fine.

Thanks for the tips, I've never looked into compiling programs on Linux but who knows. So you are saying the Tiger maps will no longer work with Xastir? Also, have you tried the latest version of Xastir, version 2.x .... thanks ... Bill k6acj

A question. If one is running an 2 way I-Gate and they have a filter at the connected IS server set to say /m 200 does this mean anyone beyond 200 miles messages will not make it to the I-Gate? I know the I-Gate will not receive positions reports beyond this far but does this also mean messages will also be trapped?

What APRS-IS server are you connecting to from the IGate? What IGate
software are you using? and what messages do you think should be
delivered from that server to that software?

Different APRS-IS servers may do different things. And different Igate
software may be adding to your filter without your knowledge.

The messages that I suspect you're wondering about are those that
originate from outside your filter's range while being addressed to
stations that you may have heard "recently" "local" to your IGate (whose
software defines those 2 words). Do you know what the actual effective
RF range is for your IGate and the nearby Digis?

Lynn (D) - KJ4ERJ - Asking more questions than giving answers...

PS. I hope your filter is m/200, not /m 200.

m/200 will set the range to 200 _kilometers_. Not miles.
200 km are 124.3 miles (1.609 km = 1 mile)

Yes your definition above is what I mean and My stations RF range is about 16-20 miles and there are plenty of digis covering about 50+ miles that My I-gate can hear.

>

Yes this is what I meant m/200.

8378. OpenAPRS developer?

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-23 14:13:07 UTC
From: Lynn W. Deffenbaugh (Mr)
Topic: 8378 Message: 8378

I'm looking to contact the OpenAPRS developer with a few questions related to an APRS messaging QSO between W7BOZ-12 and KC7CVI on 2010-12-22 02:36 through 04:09 UTC. It appears that while KC7CVI was doing reply-acks, it never directly ack'd W7BOZ-12's messages.

If anyone has contact information for the developer, I'd appreciate it.

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile and Win32

PS. Just for completeness, here's the raw logs from APRS.FI for both stations interleaved by time with all non-message traffic removed. You will notice that W7BOZ-12 acks each of KC7CVI's messages and sends the next queued message in response to the Reply-Ack, but there are no direct acks from KC7CVI causing lots of retries from W7BOZ-12. Note also that both stations were on APRS-IS, so there's no RF/IGate issues involved here.

8379. Re: Xastir 1.9.9/Linux Map Help Needed

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-24 04:18:22 UTC
From: k6acj
Topic: 8363 Message: 8379

Ok thanks for the information about compiling. I have a fairly good set of Tiger maps for AZ and CA still in zips and use them with Winaprs and would like to use these with Xastir and Linux.

In the mean time Puppy Linux was loaded and tested then I loaded FLDIGI but I'm not sure if Xastir will run on this version of Linux but Puppy is sure fast, great for limited memory machines ... give it a try but for the long run I'll stick with Ubuntu because of the many ham radio software apps available.

Thanks .... Bill k6acj

8380. Re: [APRS] Re: Igate Software

Yahoo group: APRS (2007 — 2010)
Date: 2010-12-24 05:04:25 UTC
From: Patrick Domack
Topic: 8355 Message: 8380

It works fine.

The filters are not suppost to have any affect in messages.

I'm running my igate with a m/1 and it's constantly receiving messages
to igate out. I had the same thoughts at first when I setup a 2way
igate, and for years just feed it the while aprs-is stream, raw. But
that isn't needed and m/1 works fine to keep the bandwidth down and
still gate outgoing messages. (not that the full stream really
stressed it at about 30kbit/sec).

Ok thanks for the information about compiling. I have a fairly good set of Tiger maps for AZ and CA still in zips and use them with Winaprs and would like to use these with Xastir and Linux.

In the mean time Puppy Linux was loaded and tested then I loaded FLDIGI but I'm not sure if Xastir will run on this version of Linux but Puppy is sure fast, great for limited memory machines ... give it a try but for the long run I'll stick with Ubuntu because of the many ham radio software apps available.

Thanks .... Bill k6acj

From: joe
Topic: 8383 Message: 8383

First.... Merry Christmas!

Now a request. I am wanting to set up an APRS digipeater In a campground located in a national park area. I need to put together an information packet on APRS and how it could be usefull to the park. The park has a lot of horseback riding trails, off road bike trails and hiking trails. APRS would be usefull for the special events in the park. Search and resuce would be another use. I plan on a weather station to also be included with the digi. Does anyone have any sort of news stories and newspaper clippings where aprs has been used for such?

A friend of mine is one of the head rangers, but approval for a repeater has to go through another person. The more information I can provide on how it would be useful the better the chance to get permission. If I could, I would go 100% solar so no power from the park would be required. DSL is available at the visitors center area, so I would love to make the digi an Igate too. If you have a powerpoint pesentation,that would be great.

Thanks and have a HAPPY NEW YEAR!

Joe

8384. I need suggestions/guidance on how to integrate APRStt with our digipeater

Hello and Merry Christmas to all!

Our digipeater consists of: a Kantronics KPC-3+ TNC and a Yaesu FT-3000M 2M radio.

I would like to get recommendations for equipment to add to this setup to implement APRStt functionality, whether it be added directly to the hardware or initiated and controlled remotely.

Thanks,

Mike (KN8J)

Tournament of Roses has not used Amateur Radio Ops for the last 2 or 3 years since Nextel gave them a deal on PTT phone service. Since there are no Ops around, there has not been APRS that I know of. We will find out in a couple of years (2013?) what happens next when Sprint finally pulls the plug on PTT.

As a thought, try to also say how it will NOT intrude on the other visitors trip to the park. How it it will not be "unsightly" "obtrusive" "noisy". Try to show them that it will blend in to the park as it provides a service to the ham community. APRS.org has info on the parks also that shows about how many hams (average) visit the parks each year.
Good luck in the endeavor and let us know how you make out. When it gets on the air make sure you have aprs.org updated to show that there is aprs coverage in the park.

You basicly just need another 2mtr radio (bare bones is all you need) such as a hand held and a simple digipeater such as one from foxdelta http://foxdelta.com/products/foxdigi.htm for a simple aprs digipeater. @nd radio is needed due to the fact that APS in packet use different freq. There is a guide on that page for more info.

Mike is actually asking about APRS Touch Tone (he wrote APRStt in his original message) which is an entirely different situation from just a regular APRS digipeater.

At the moment there isn't anything for APRStt because it will need a bit of extra hardware for decoding and translating the touch tones into something else. Bob claims the specification for APRStt has been around a while but no one has implemented it. A couple people have offered but with no results yet.

Alex,

Thanks for your response. I have not kept up with APRS developments and I am slowly relearning what I should already know.

So, am I correct in saying that APRStt has not moved beyond the concept stage? It seems to me that it is still possible to implement this locally, whether or not anything gets to an iGate. Please correct me if this is an untrue statement.

Also, what can I do, if anything to promote implementation?

I think his question was is there any real world applications of APRStt yet and not what are the specs. I can read specs all day, but if no one adopts those specs or provides hardware to facilitate its use then it just becomes moot. I am also very interested in APRStt and would like to work with Mike on this, but I don't know of any hardware myself to help him with this idea. I implore anyone with working knowledge help everyone better understand this new technology.

I started on an APREtt implementation as a TinyTrak4 daughterboard.
It allowed for 2 radios, one on the APRS side, and one on the TT side,
and whenever the proper TTs were received, it sent an APRS object
packet on the APRS radio, and also the the serial port. It also could
send CW acks back on the TT radio. I had a prototype running at last
Dayton, but haven't made much progress since, partly due to to what I
thought was low interest in APRStt.

If those interested in APRStt beta testing want to contact me off
list, I'll start a list and get the development going again.

Thanks, Byon.

I would like all interested to contact Byon to get this development going.

I'm surprised so little has been done to implement this feature which would open up APRS to virtually every ham.

Caution: seek real functionality. I've considered the possibility that this could become as ubiquitous as "kerchunking" a repeater. Obviously, this has potential create unnecessary congestion, but used properly, I believe it could fulfill Bob Bruninga's vision of a universal information channel for amateur radio.

Comments?

No, that link was designed for a java-enabled browser. Basically, it
just googles "APRStt" for you. Give it a try from a desktop browser
sometime. Glad you found the info anyway.

Topic: 8396 Message: 8403

I would like to see this project moved forward. I have been setup to integrate APRStt with my VHF voice repeater. Yes this can be done.

Byon my only concern would be can the same unit also work as a Digipeater and at the same time work as APRStt. Limited space and equipment.

I too am certain that APRStt will revolutionize ham radio by
bringing basic APRS "presence" to everyone.

There are two APRStt initiatives on a back burner somewhere...,
Byonics is currently the active developer on APRStt hardware.
And his APRStt in hardware will be a great addition at repeaters
or on simplex frquencies (146.58 if available).

Doug Quagliana is working on the speech side that can be used to
provide APRS info back to users... He had something working at
Dayton, but I have not heard much since?

Bob,
I completely agree with you, I feel that when we can implement APRStt it could bring new life and a new user base.

Mike and Myself are willing to work with Byonics to be beta testers. I hope we can all see the broad implications APRStt has in the future and its uses. Everyone using APRStt on every make and model HT!

The initial prototype did not function as a digipeater, but it is
possible that that could happen.

Some way of the user interfacing to a repeater controller would be a
possible idea as well. What I mean is this:

User transmits a signal on the input of the local voice repeater and says:
"This is call sign sending Aprs Gps info."
The Dtmf code starts with a series of digits for the repeater controller to
act upon, such as, for example; digits 123 mean controller will run a macro
to pass DTMF audio to port "X" for "Y" seconds and only to that port. Port
"X" is where the Aprs TT device decodes the touch tones and sends the data
to the Aprs system. The Aprs TT device would not have to be at the repeater
site, it could be anywhere within range of the transmitter on port "X".
(Aprs transmitter not required at repeater site.)
If we can get a DTMF string to precede the actual Aprs data, macros at the
repeater site can ensure all DTMF tones are muted, can only be used for that
purpose, and be directed to a particular port to have minimal impact on the
voice users.
Most controllers automatically mute DTMF tones, the problem of voice users
hearing DTMF is solved, and the Aprs user just adds a few more tones to his
memory string.

Just thinking out loud, hope that made sense!

I would like to see, in the future, APRStt ubiquitous to any and all APRS digipeaters as that is the only way we can get a huge user base to use APRS. Right now I would just like to see some form of device for use locally and have a chance to refine this technology.

I thought APRStt was designed for use on a separate frequency like tapped into your local voice repeater, not the shared AX.25 APRS frequency. Or am I missing something? If I'm right, it would not be "ubiquitous...all APRS digipeaters", but instead ubiquitous to all VOICE repeaters! Talk about serious national coverage for anyone with a DTMF-capable radio!

Normal voice controller will block DTMF signalling from passing through the repeater. I actually use NHRC controllers myself. The issue is that DTMF is used for repeater control on the backside. I took care of this by removing that control from the repeater main receiver and putting it to a UHF control receiver. Now I can use the repeater input for DTMF input from APRStt and not have to worry about anyone hacking the repeater command set.

APRStt is a tie between the non aprs world and aprs
allowing a radio with DTMF to access the aprs world by sending a series of DTMF tones to identify themself and thier location to the APRS network.

But, What is APRStt could connect everyone utilizing more than just
location; ie: text messages, email, internet, etc.

APRStt is a tie between the non aprs world and aprs
allowing a radio with DTMF to access the aprs world by sending a series of DTMF tones to identify themself and thier location to the APRS network.

8415. Keyboard interface & HT

Question.

I am a new to the HAM community, so please excuse my ignorance in advance. I have been involved in technology for a long time until a friend of mine, Mike (KN8J) peaked my interest in APRS. I purchased an RC-D710 with the intentions of creating an HT setup similar to what Bob did. With that said, I am realizing there is a problem with input, it is a slow and tedious process and a limitation to APRS.

What I mean is that using the keypad is fine, but long and kind of unnecessary. I am starting to feel the need for a keyboard on an HT or something more than a keypad. Pardon my reference, but similar to the need for them on smartphones and cellphones. If we are to get a mass adaptation there needs to be an easy way to utilize all of its features.

I am contemplating hacking away at my RC-D710 to use the keyboard over serial(if possible), but I think that if we can incorporate Bluetooth with a VX-8DR/R we should be able to make or allow a keyboard to be connected to an HT/mobile unit to allow better data input.

Another idea I have is to create a device with a dedicated transceiver(Micro-Trak TinyTrak4) in the same case as a picoITX motherboard(EPIA-P820) using either an SSD or CF card as a hdd in a fanless case, and mount some form of 7in monitor(touchscreen or not) and keyboard on this device. This device should be light and self contained, with a battery life of 5 hours on transmit/receive. I think I could make it work.

My question is this: Why are we still so limited to computers for data input and monitoring with APRS when we have so many great technologies at our fingertips for pretty cheap.

If anyone is interested in my ideas please let me know and I can discuss them with you, on or off the thread. Thank you everyone!

FWIW....

There was a keyboard interface project in one of the mags soon after the TM-D700 came out to do just this. It involved a board and PIC, I believe, and eventually evolved into a kit. It used a standard PC keyboard with PS2 connector. FAR Circuits had the board, which I bought, only to find the author had switched chips and the board was useless.

I never saw anything else about it after that.

FWIW, I have one of the completed kits for the D700, and it works wonderfully, once you learn the Fkey short cuts. Honestly unless I'm working an event, I find it just as easy to tap the letters while driving. If I'm working an event and am stationary, or have a copilot, then I hook up a laptop to the serial port and use an APRS software for the event... of course, I don't have the money to spend on a 710 just yet...

With bluetooth in an HT, and my Android phone having bluetooth......why not have a droid app talking to my HT? Seems to me the hardware is all there, we just need the software to go between them. Set it up to act rather like a cross between Xastir and any generic instant messenger program, I'd sure run it! Also keeps prices down somewhat as many of already have some kind of smartphone; no need to duplicate hardware.

So many ideas so little time...

Bluetooth in an HT expects to be talking audio as a master to a slaved
headset. Bluetooth in the phone expects to be a master talking audio to
a headset with one profile, or a master talking data via SPP (Serial
Port Protocol) to a serial-type device like a GPS or Bluetooth to serial
adapter. Getting the master BT in the HT to talk to the master BT in
the phone is probably not possible.

My thought is that with the Kenwoods the texting is tedious with the key pad but it helps in a way. APRS was never designed for long winded messages like email and the like. At 1200 baud and everyone on one channel there really is no need for the keyboard. I do have one for the D700 but something broke in the box and have not bothered to fix it. As much as keying in a message on the number pad is a pain it keeps the airwaves clear in a way.
Just my $0.02 on the topic...

Was this not in the aprssig group?
Anyway, I just received my bluetooth module. This will be posted in aprsisce also. The module will allow me to interface aprsisce on my phone 2 my kenwood th-d7a/g. Therefore use the keypad on the phone 4 messages and much more. Success with bluetooth 2 bluetooth. Now just doing serial data conversion. Will be finished this weekend. Much smaller, less power, and cheaper than most bluetooth 2 serial adapters. Not going 2 post more here and no pics or docs yet. But will post 2 aprsisce group and webpage.

Hello All,
Happy New Years!!! Currently run a N9MXT-10 DIGI/I-GATE node at the home QTH and has been up for wow long time now. Used to run a TinyTrek into a radio in the mobile but some that off and replaced it with a TM-D710. Well, I did a trade for that 710 radio for a 706 with a tuner which I couldn't pass up. Anyways, looking to rekindle my APRS back in the mobile again. Anyone have a mobile setup they are looking to get away from?? If so I am the guy to contact! Let me know

Thanks

And be safe out there tonight all I will be watching the APRS traffic.. j/k!

Jeffrey
